Workflow All In One Dynamic Approval V17

The app you can create desirable approvals without any customizations. The app can create approval dynamically.It supports all modules containing the Header, State fields with Selection Type or Stage id as Many2one, Company field and Context.The application can be supported in Odoo Community and Enterprise versions.The new features will be freely available on the app update.The approval does not affect old records, If you haven't enabled the Apply approvals to old records Instead it will be applicable only for newly created records.

Key Features

- Support Multi Approvers.
- Support Multi States.
- Apply approvals to old records.
- Add approval status to tree view with desired configurartion.
- List the Approvers Approval Status in Records.
- Rejected Record Resubmitting Option.
- Approval History In Chatter.
- Store Approvers individual duration of record approving.
- Filter Approvers individual duration of record approving.
- Different Approval Methods.
- New State/stage_id Specific Approval method. 

- Approval for CRM generated Quotations. NEW
- Email notification on creation and cancellation of approval to Authority. NEW
- Added Approval type with normal, employee manager and custom type of approval. NEW
- Tracking for field Approval id with extra security. NEW
- New Hierarchical Approval. NEW
- Added New User group Manager. NEW

Configuration

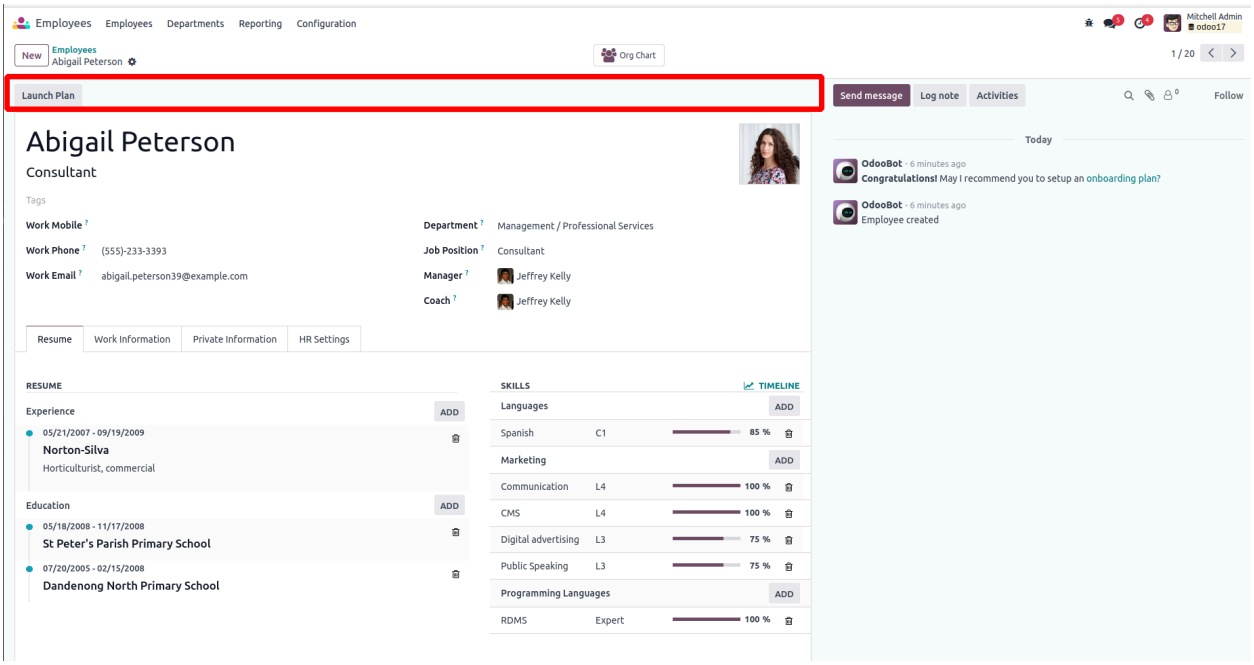

Before uninstalling the module you must need to cancel all created approvals.

If you need any configuration support, raise a request on the itcs@kascco.sa or its@kascco.sa mail.

Approver creating modules need to have Header, State field with selection Type, Company Field, Stage_id as Many2one and Context. The Approval is only working with after module configuration records.

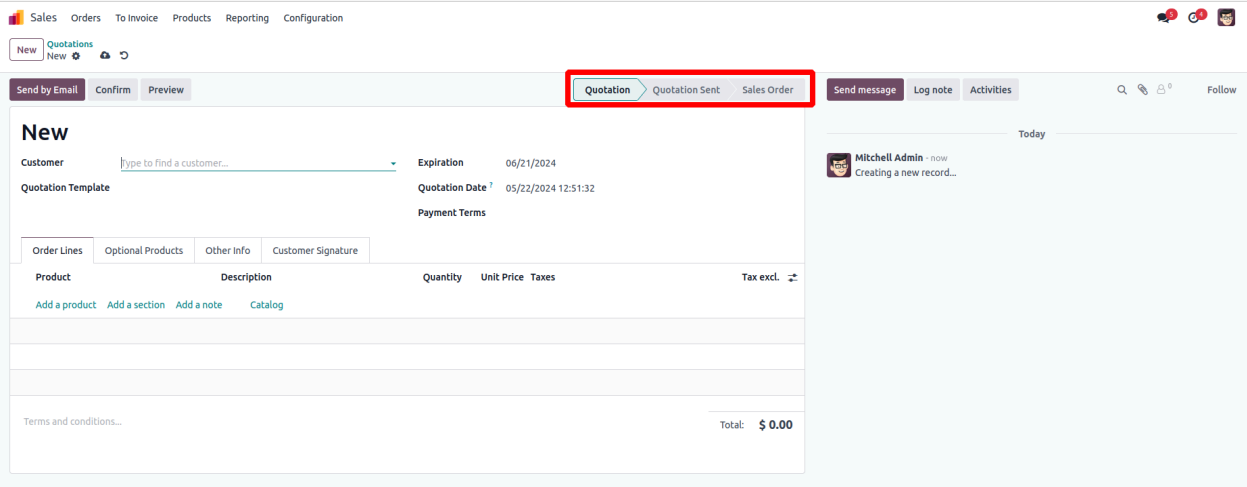

It is important to enable the Approval types in configuration ->Settings to set approvers for approval module. It is well explained below.

1.Header

The marked area known as Header.

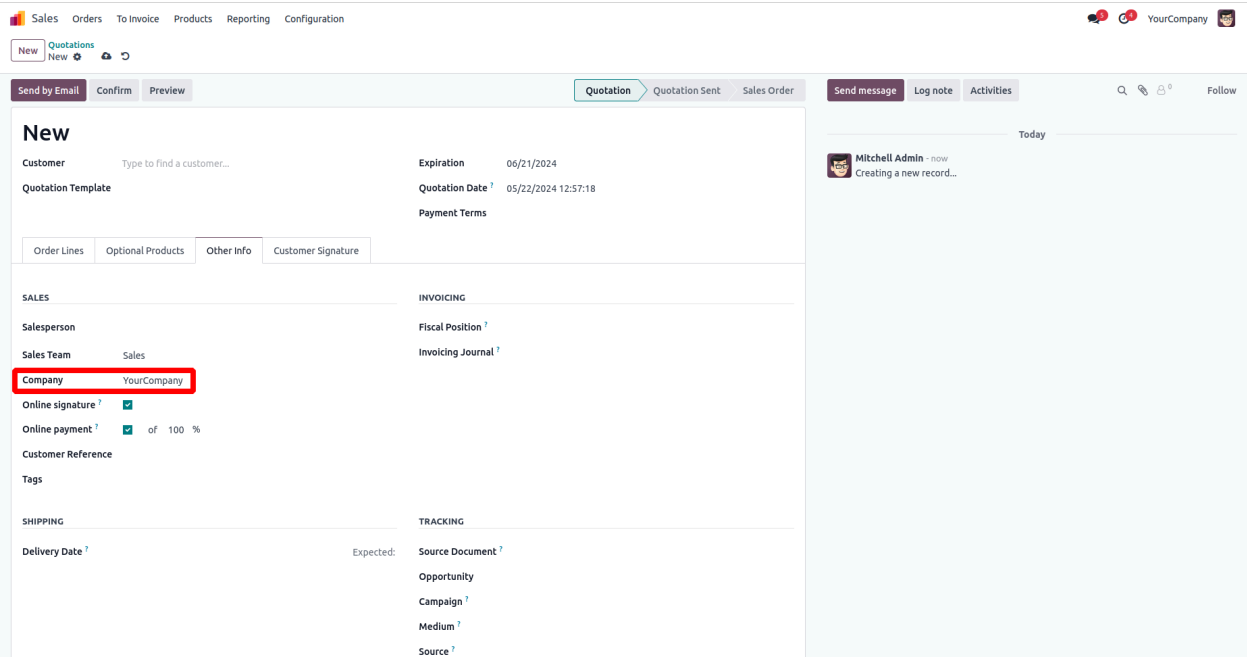

2.State Field

The approval creation planning wants a state field with selection type and field name must be state.

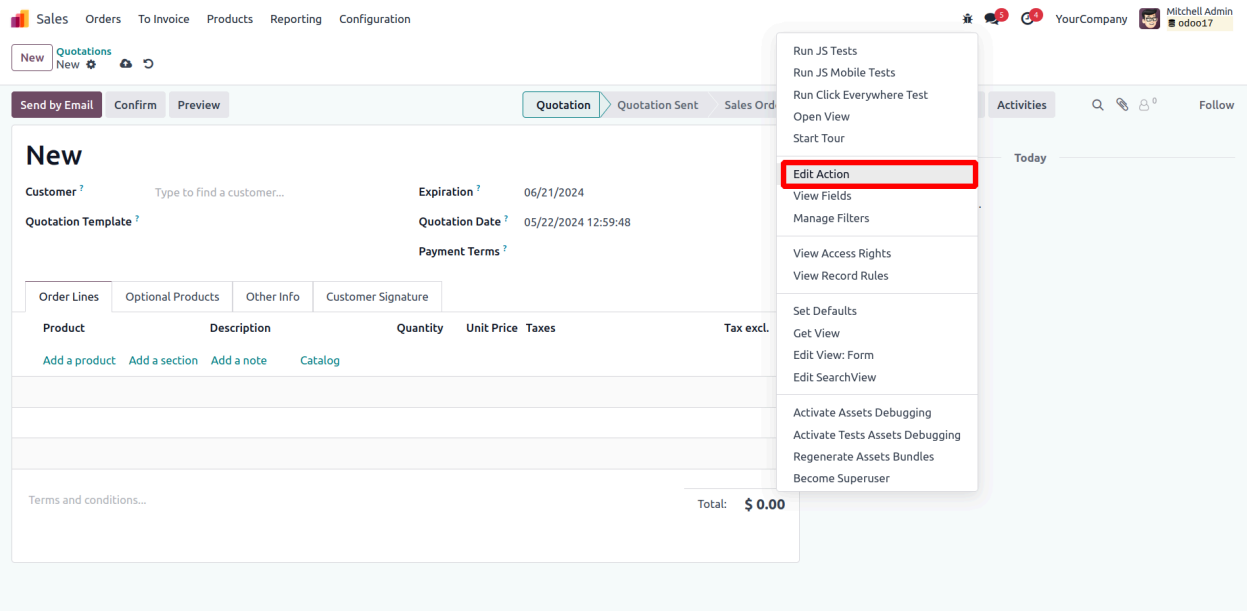

3.Company Field

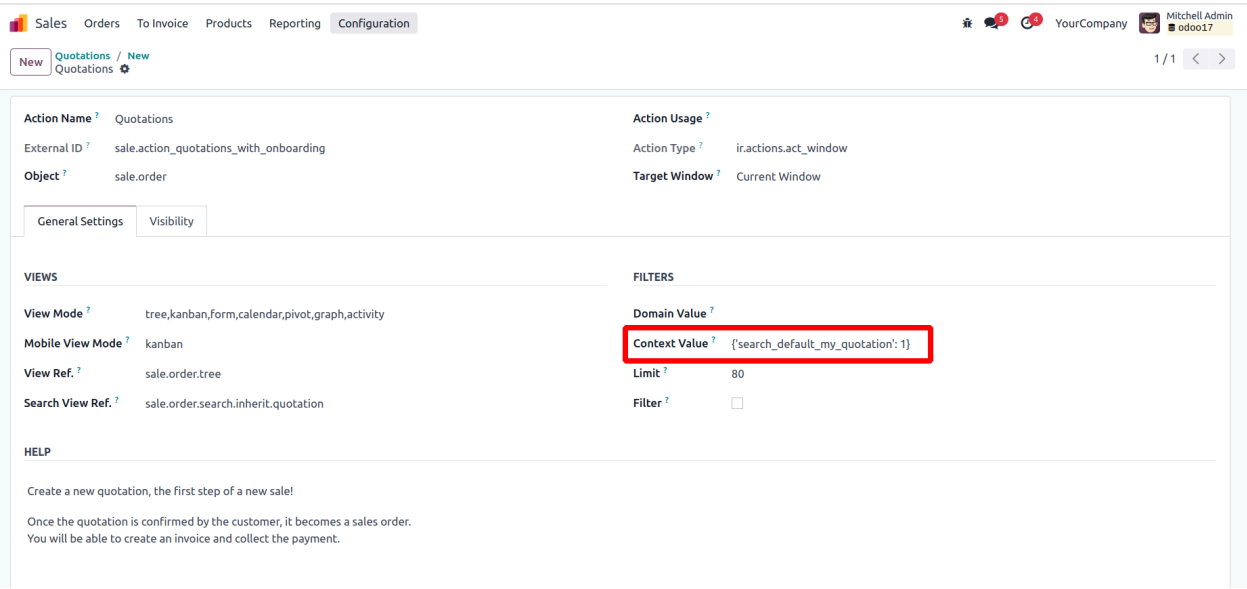

The approval creation planning module wants a Company field.

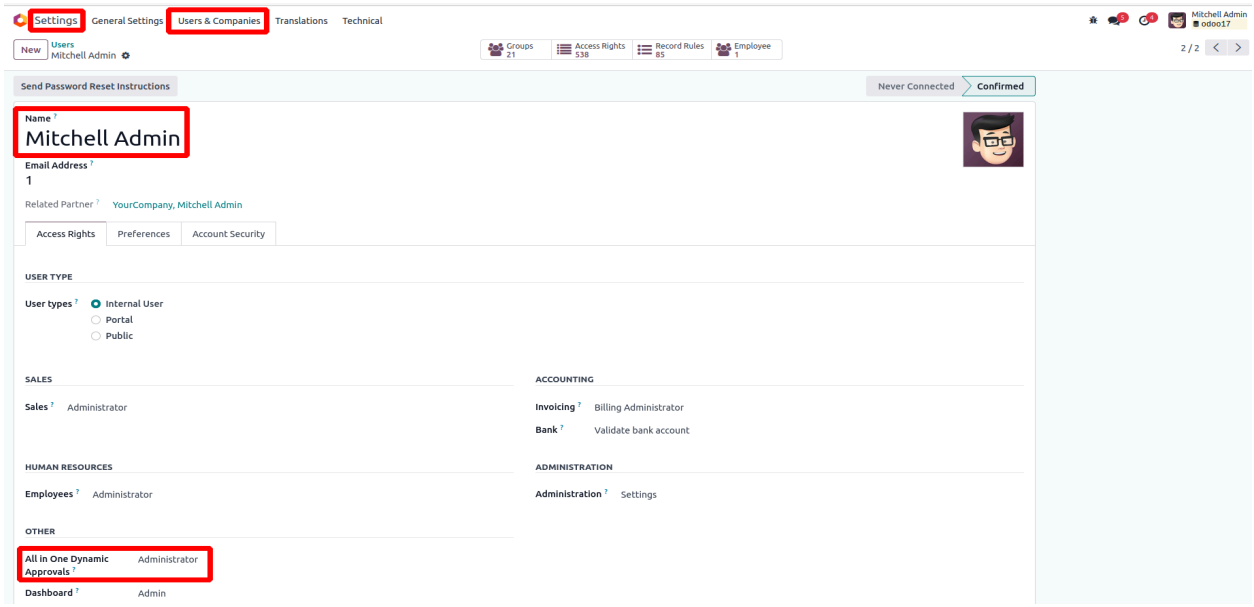

4. Context

The approval creation planning module wants a context with value.For checking first you need to enable Debug mode(Below Mentioned How to enable Debug Mode) and click the debug icon -> Edit Action.

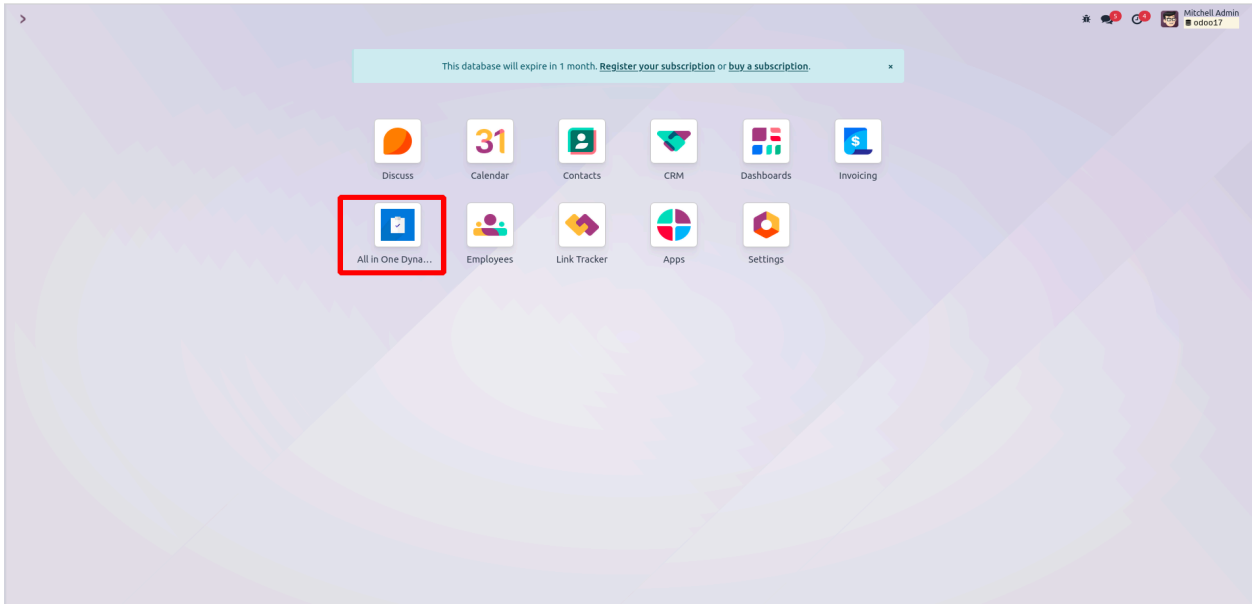

After the app installation you need to set the user group. **General Settings -> Users -> All in One Dynamic Approvals -> Administrator / Manager / Approver**

- Then you get the app in Apps.

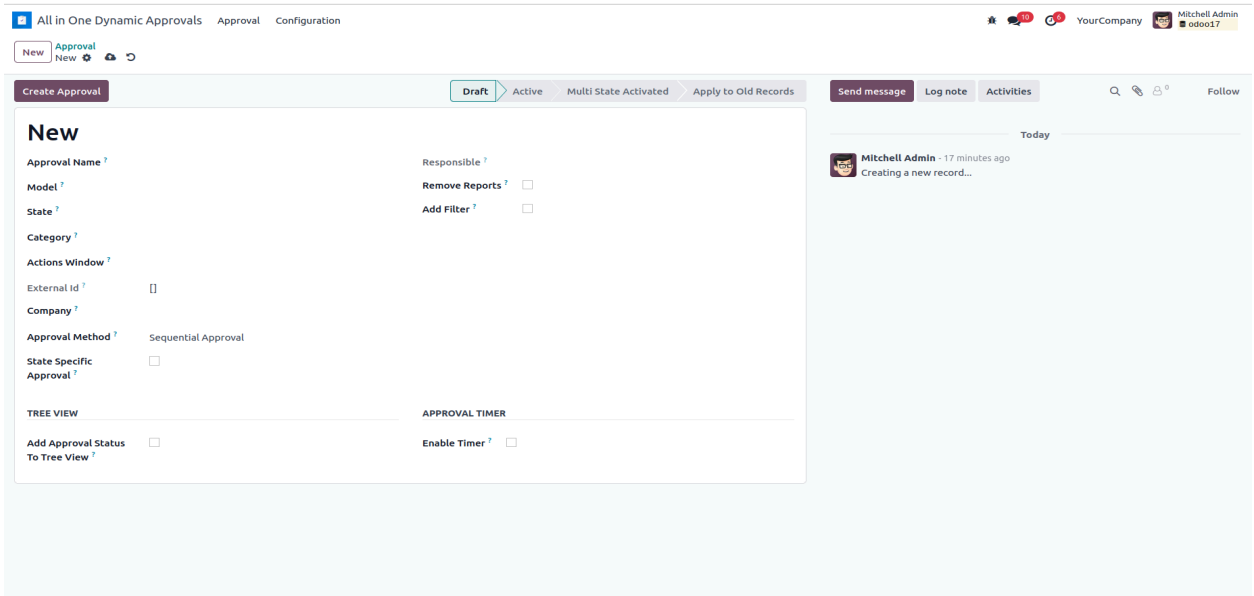

Next we can check how to create an approval.

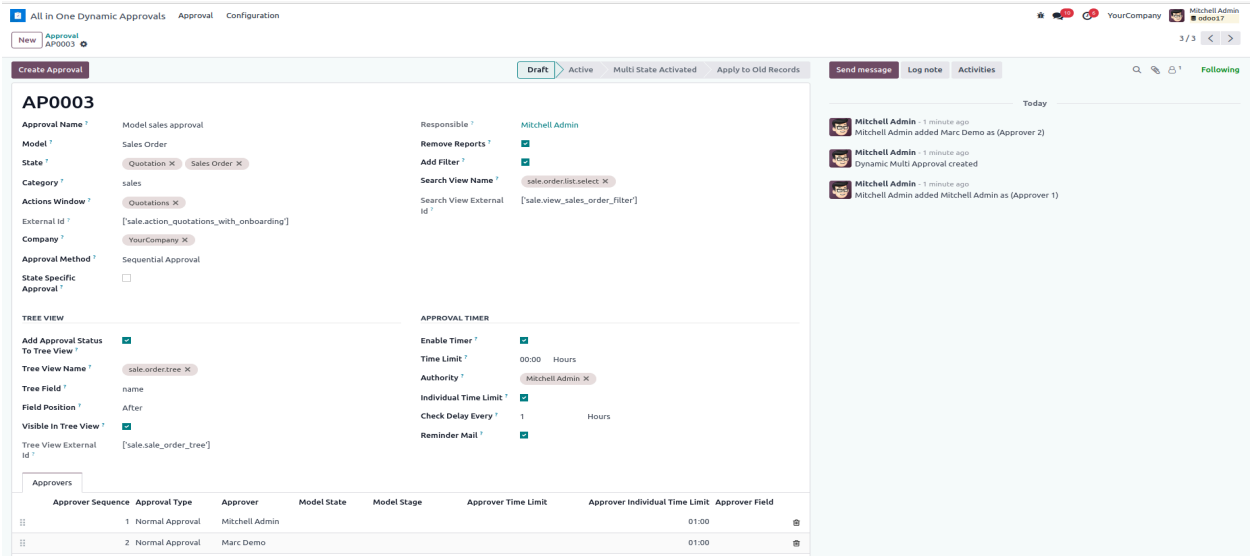

First open the app and click the new button.

Next you get the approval creation form.

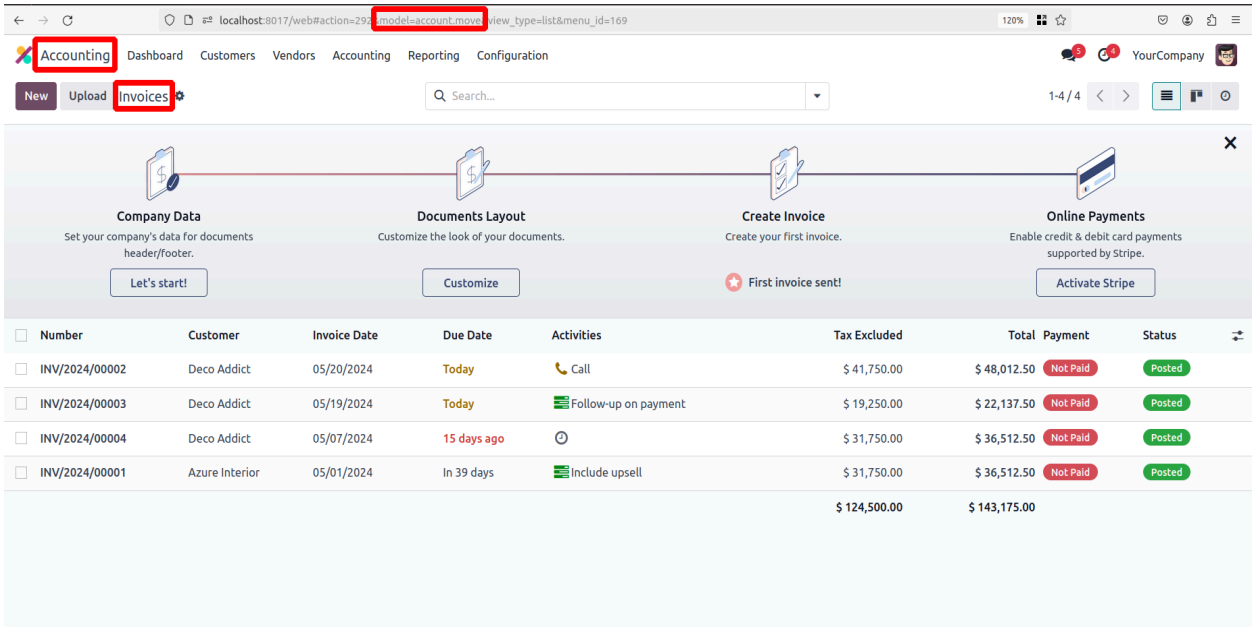

Then fill the field as per your need. Below I'm attaching the sample.

Next we can check the field one by one

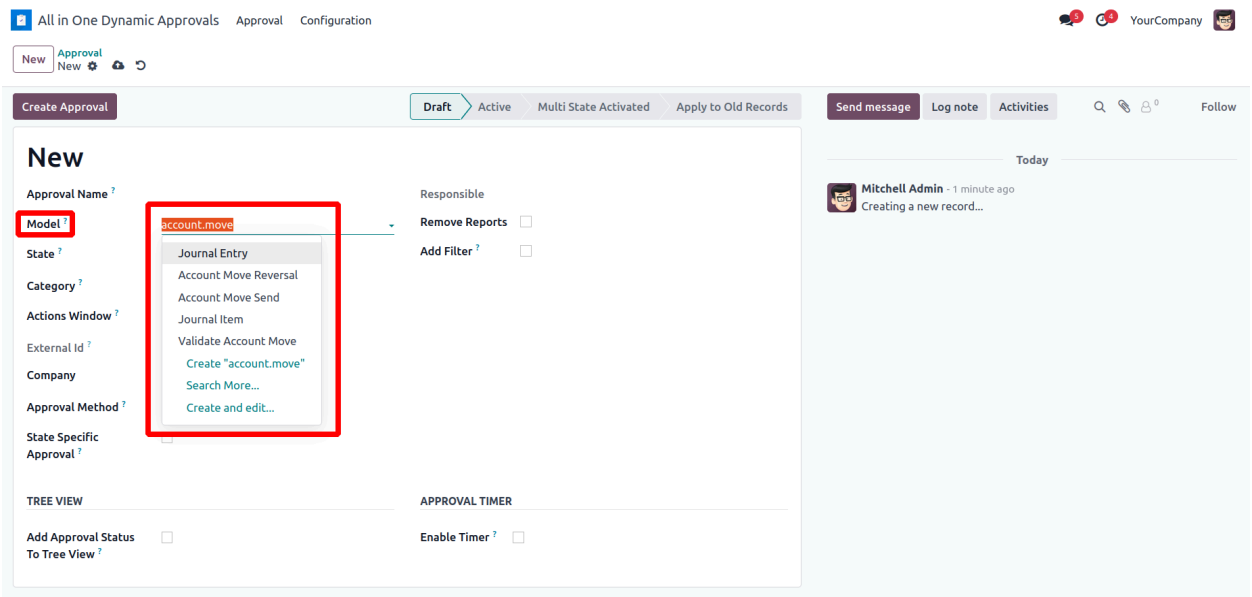

1. **Approval Name**
   We can mention the name of approval.

2. **Model**
   Here we need to mention the approval creating model.The field will display the model name. In the above screenshot we created accounting module approval . Here the model name is listed in the Journal Entry. Some cases the model name is not the same in the module. In this situation open the approval creating module and check the url. In the url the module name is mentioned.(check below screenshot)

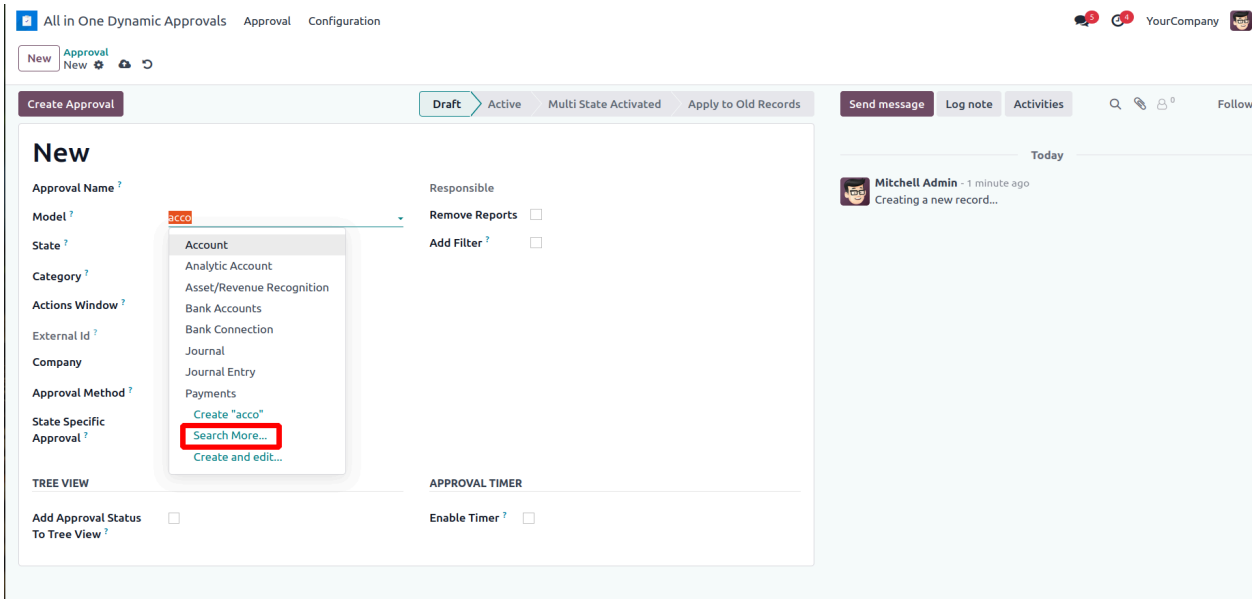

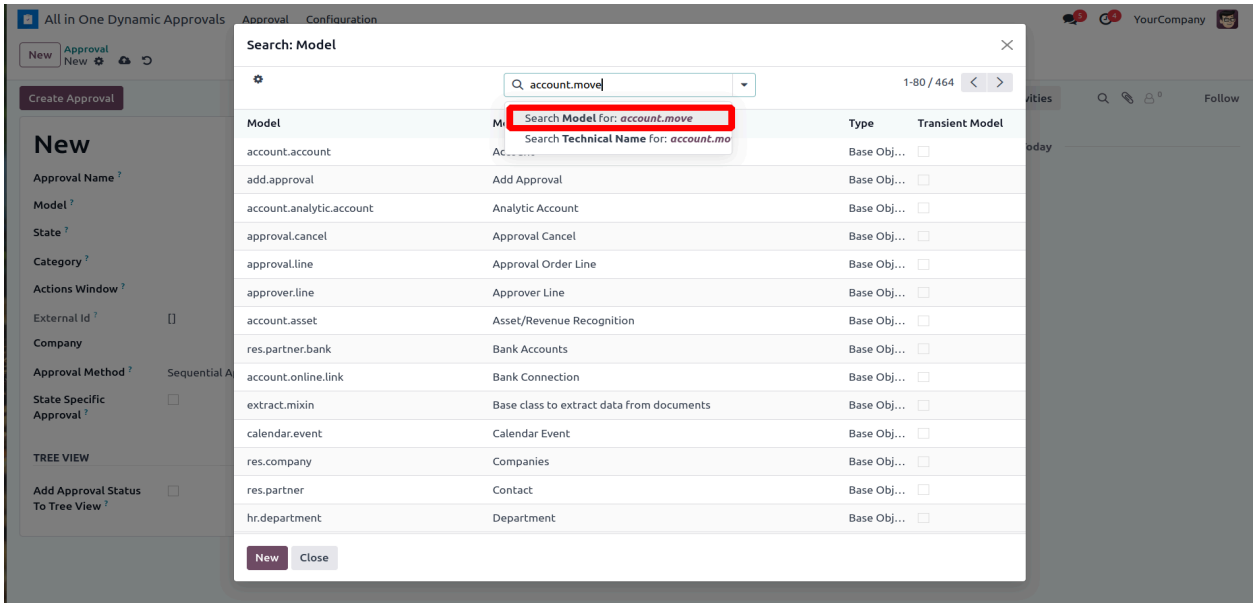

In the Url you get the model. Then you can enter the model in the field or ‘Search more’ option and search model in the search box. Then you get the corresponding model. The Both steps screenshots are added below.

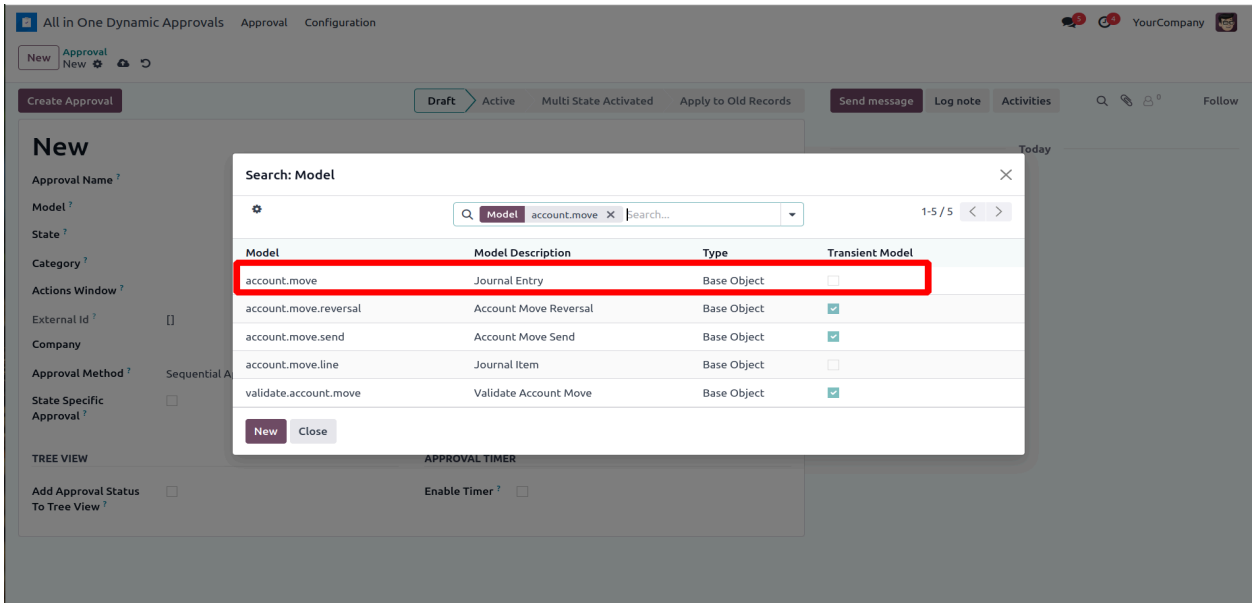

First Option:

Second Option:

3. State

This field will display the above selected model state values. Here we need to choose the approval wanted states. The model state field type must be the selection. This is one of the conditions of the approval creation.

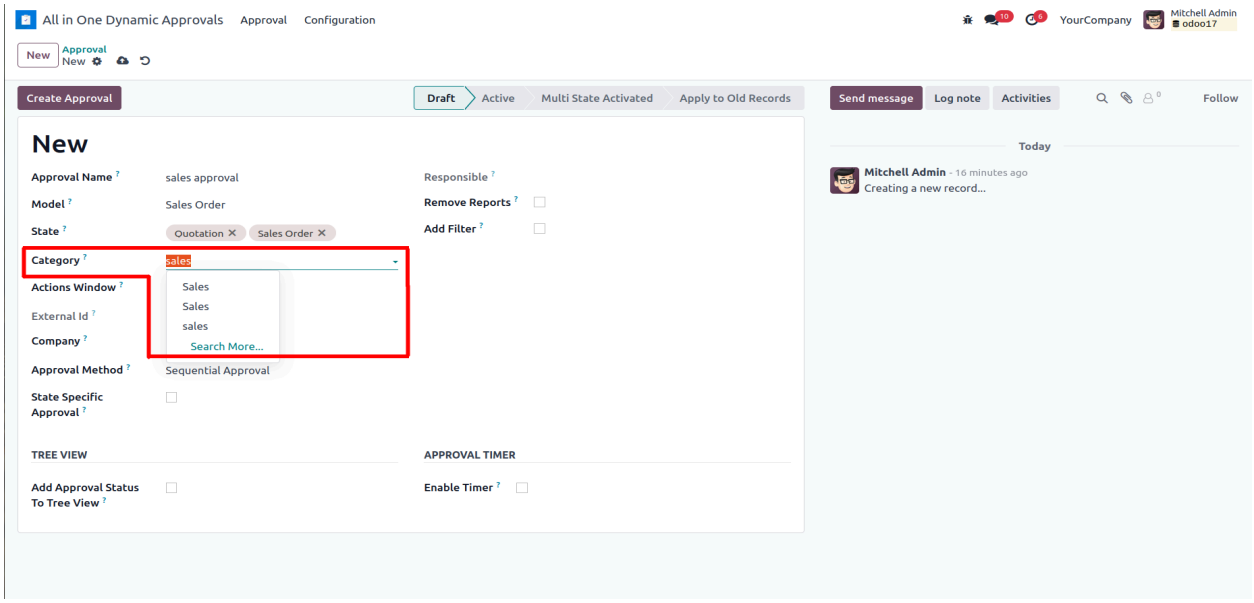

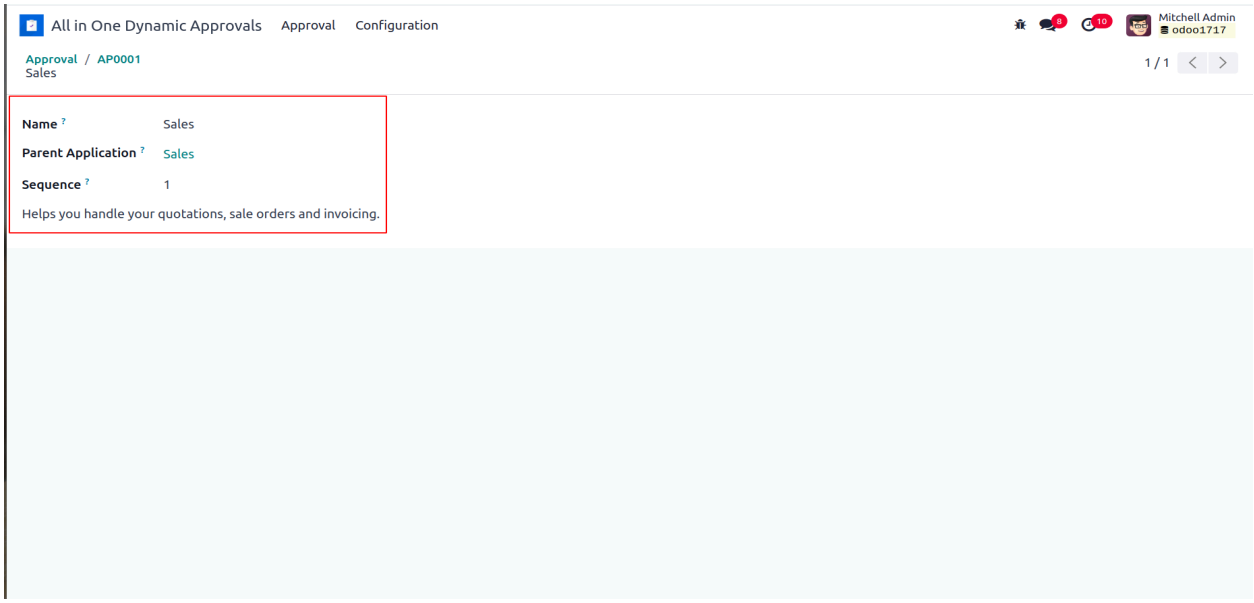

4. Category

In this field we need to choose the module group category. Under this category, set the user as approver. Allowed people can only

approve the records. Also we can see more options. Here we need to search the module group category.

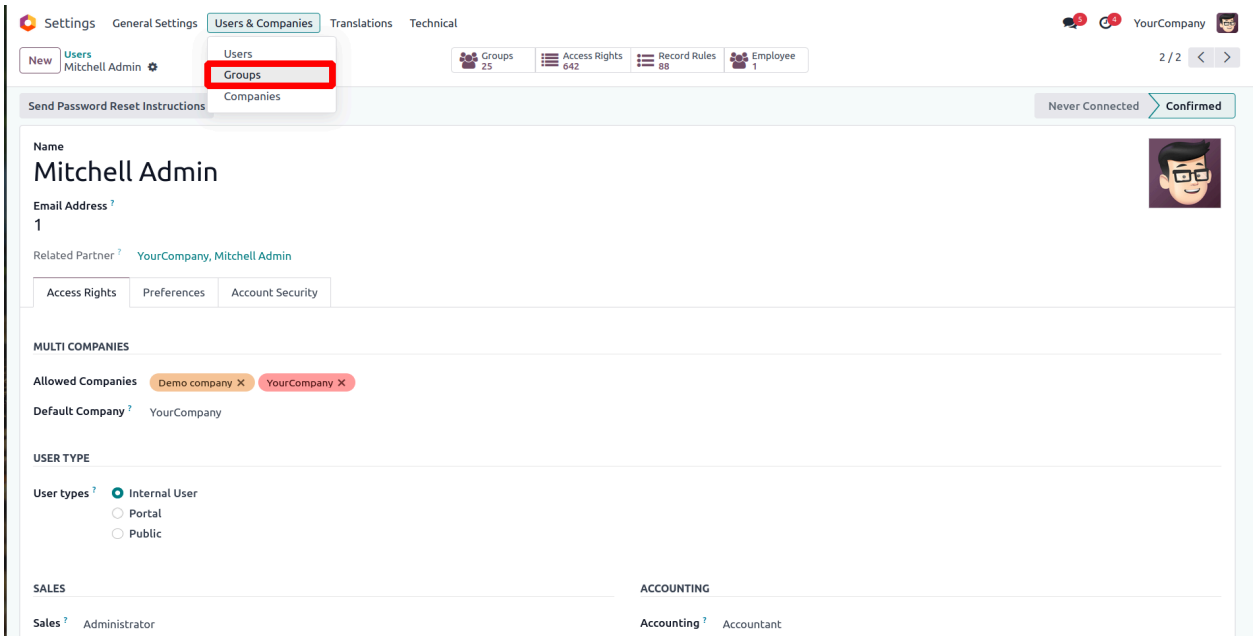

Then select one and click the external link. Then confirm the correct category is chosen.

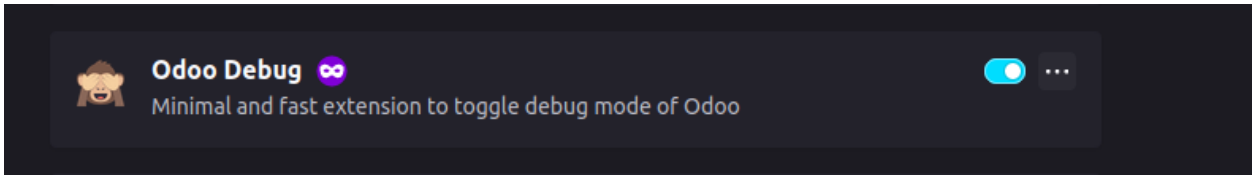

For the confirmation go to the **General settings -> Under User&Companies -> Groups**

In the normal case the group option does not list. In this situation you need to enable Debug mode. There is two ways for this

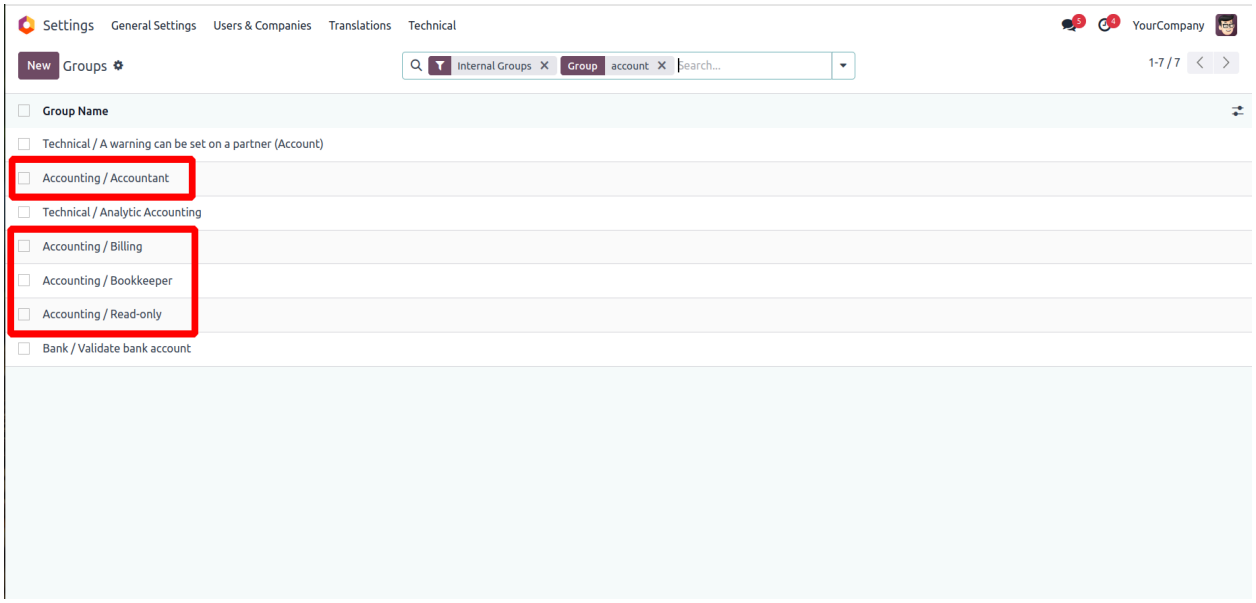

1. Add the “?debug=1” after web in Url

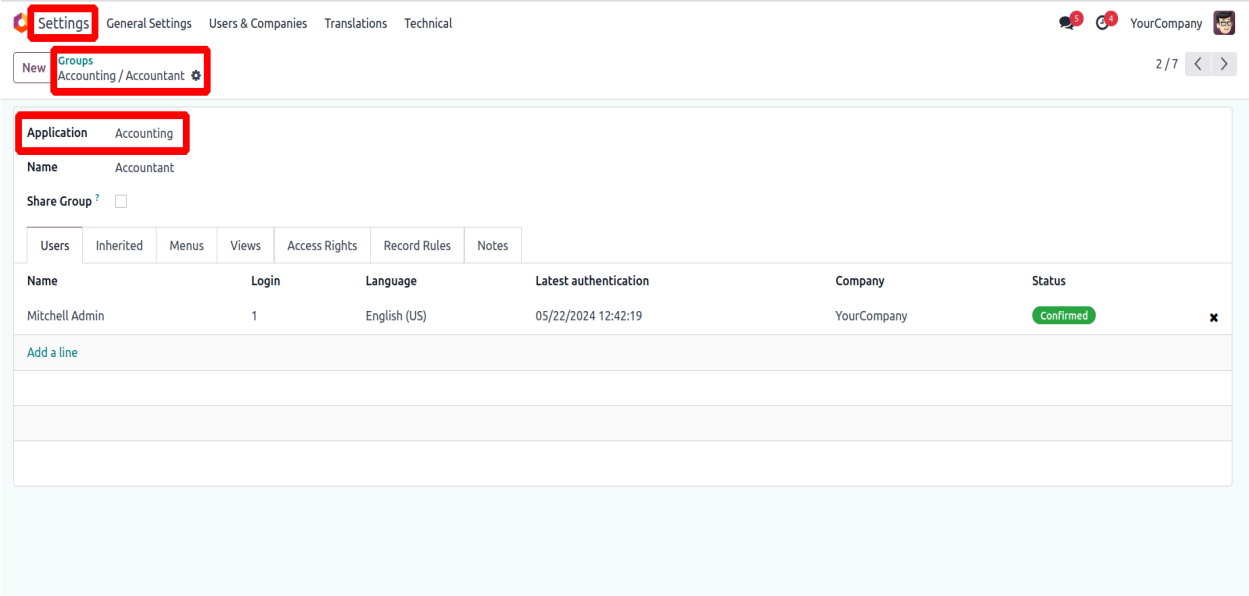

2. You can use the odoo debug addon

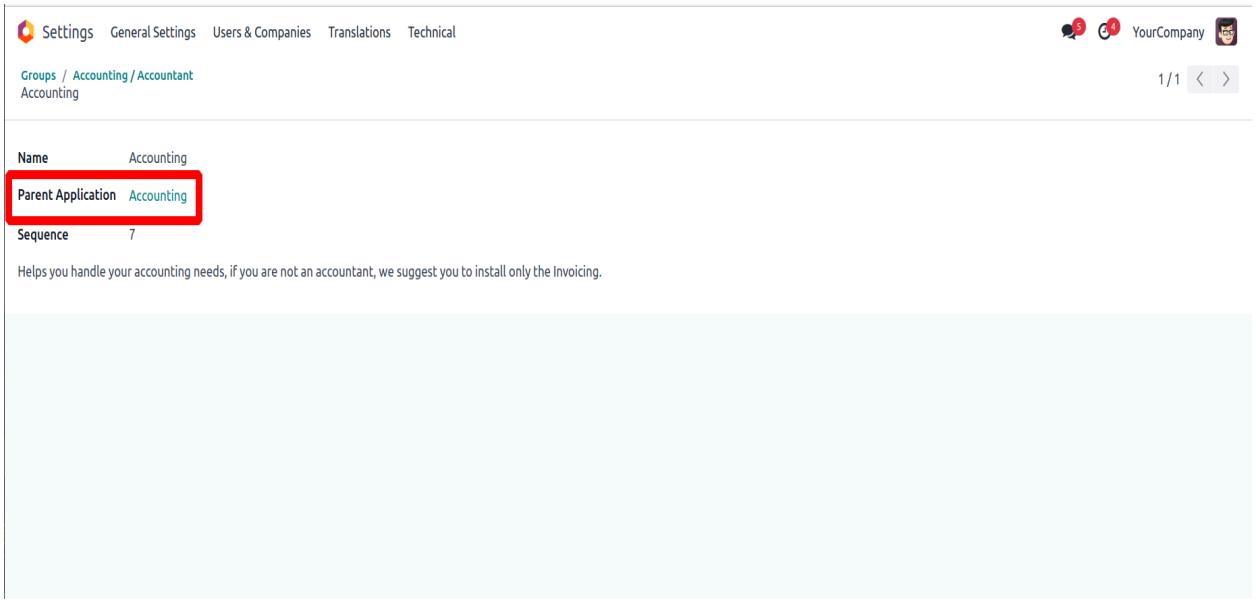

In the group Menu you can search Module name. Then get the list of groups.

Here you can open a group and click the application value. Then you get a wizard.The wizard values matching category need to choose on the field.

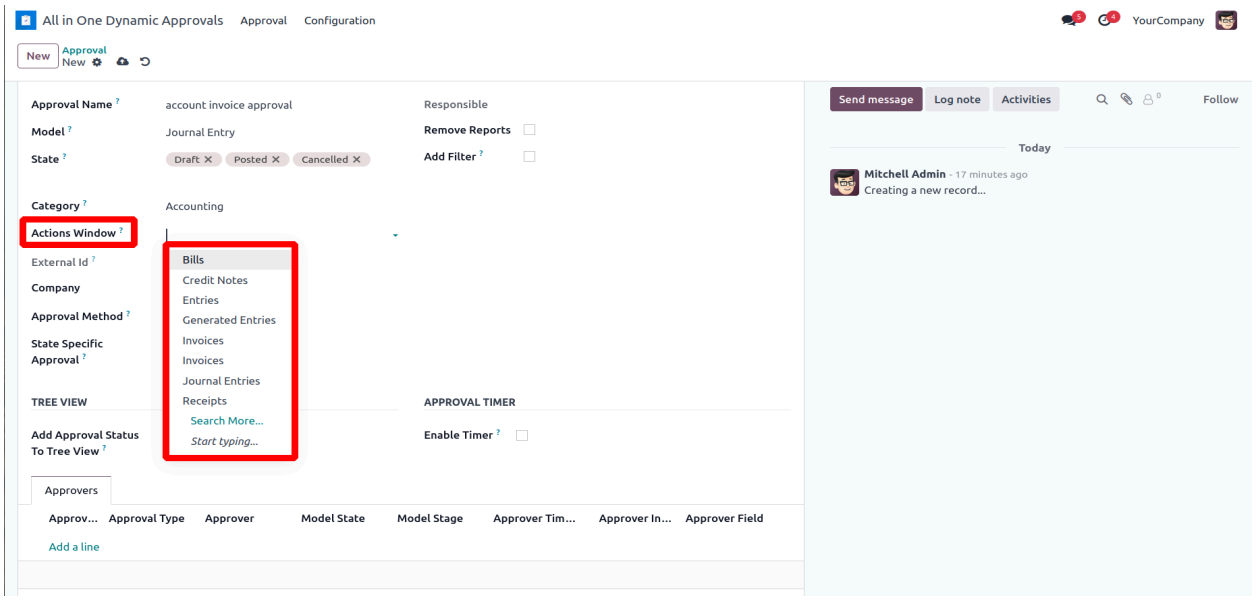

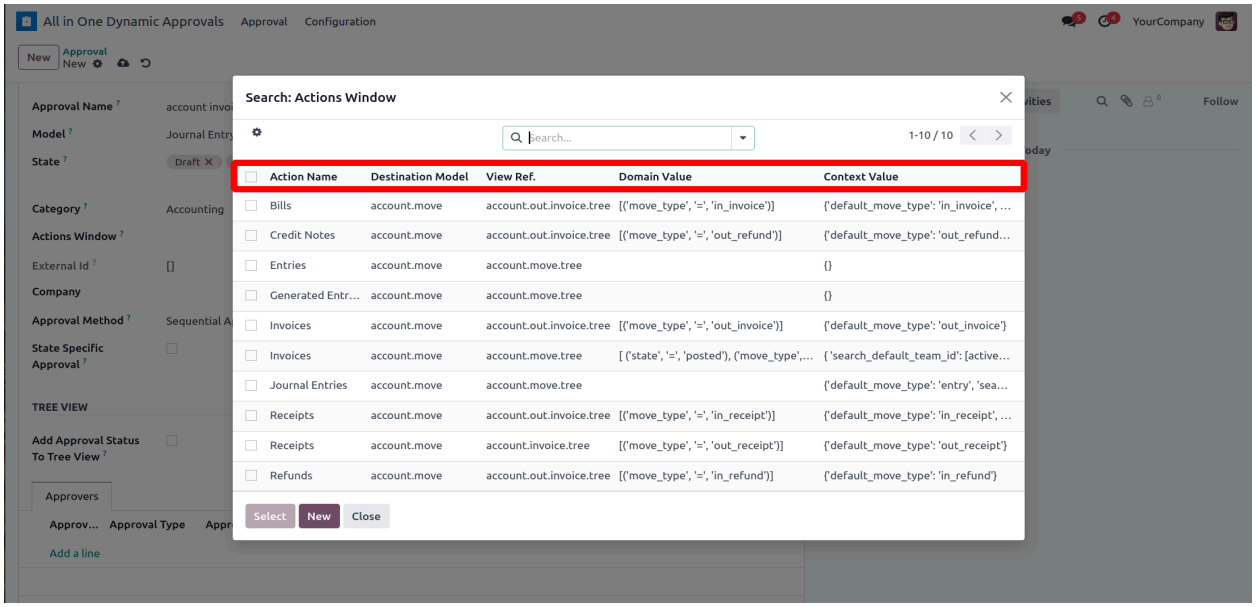

Compare the both and select the matching category .

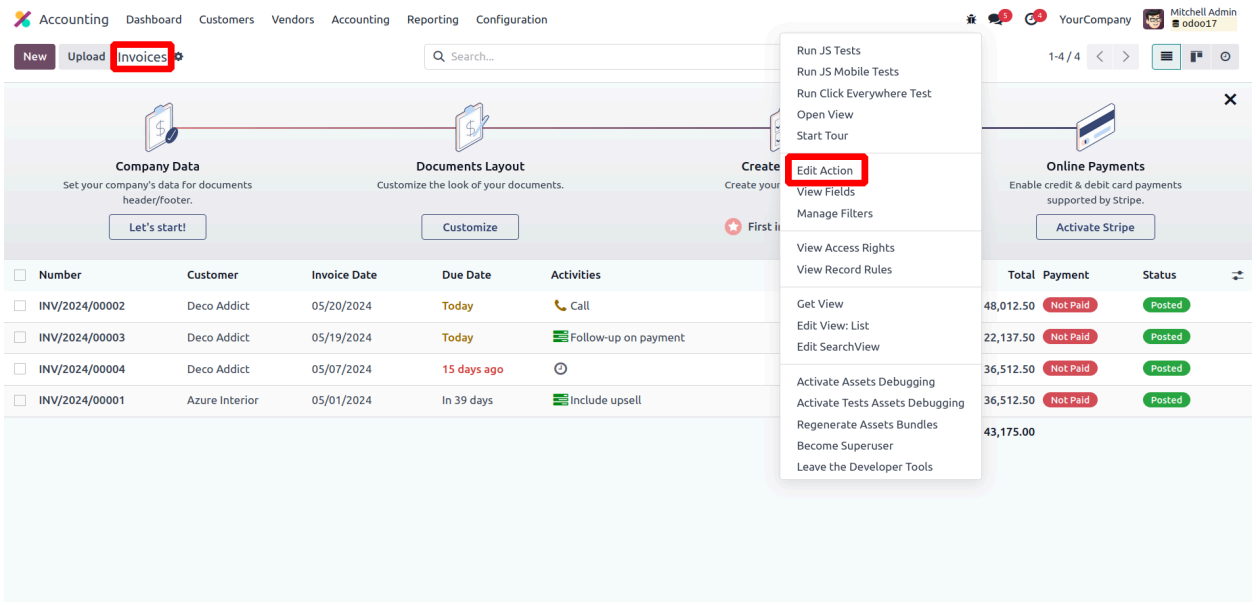

5. Actions Window

In this field we need to set the approval needed for module action. Click the Search More option. The Accounting Module is using the same form in different options. That reason, for example screenshot you can see more values. Normally case modules have one value.

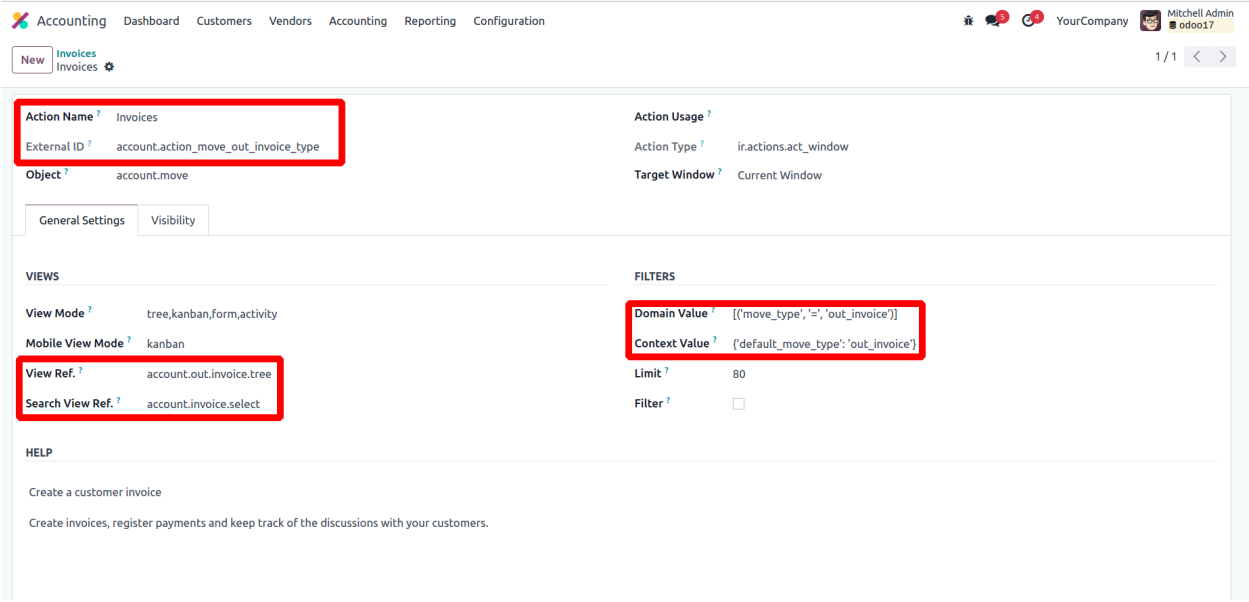

In this list you can select your model action.For the value selection go to the approval creating module and enable debug mode .Then click the icon and take the Edit Action menu.

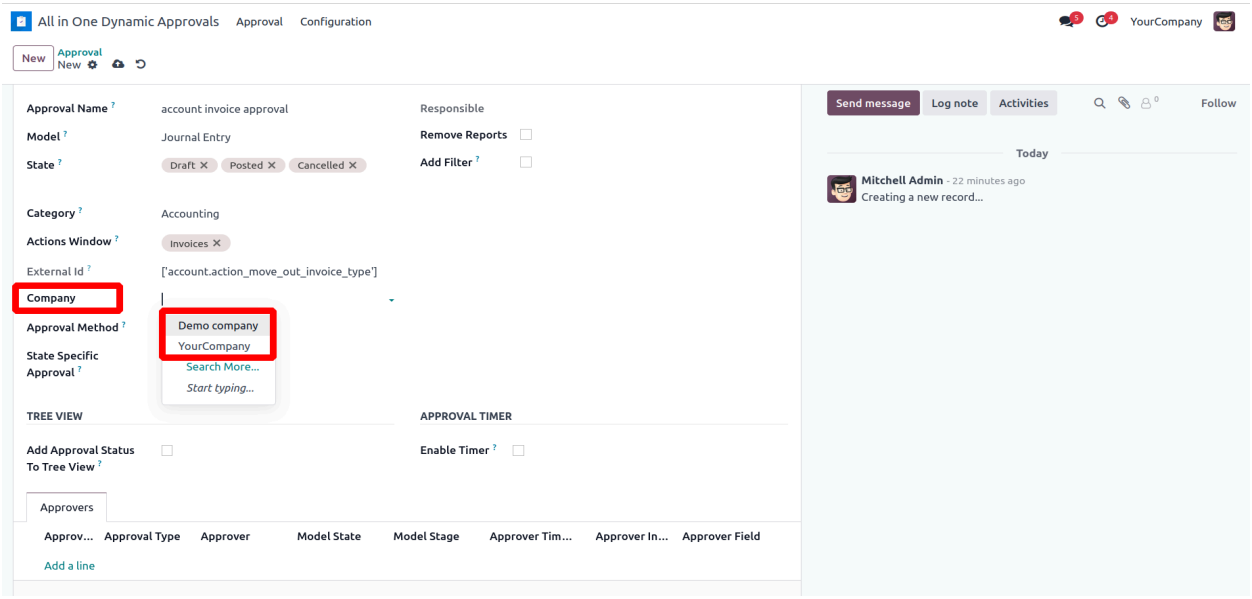

Then you get the form, Compare Values with listed values in approval form and choose the matching one.

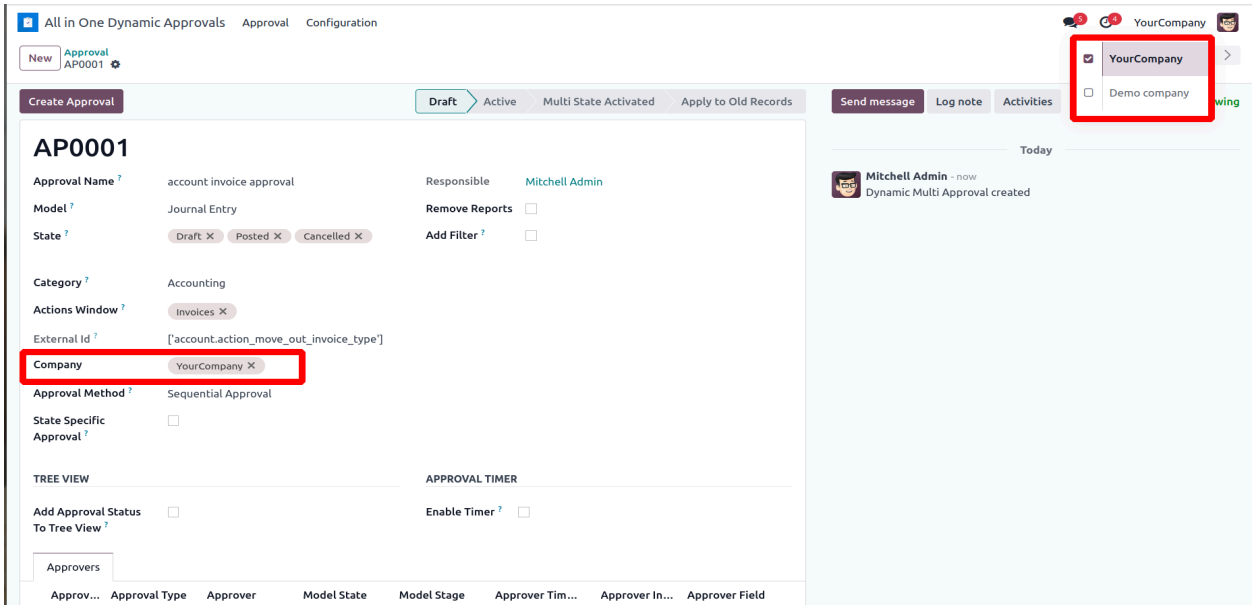

6. Company

Here you can choose the approval effect needed by the company.

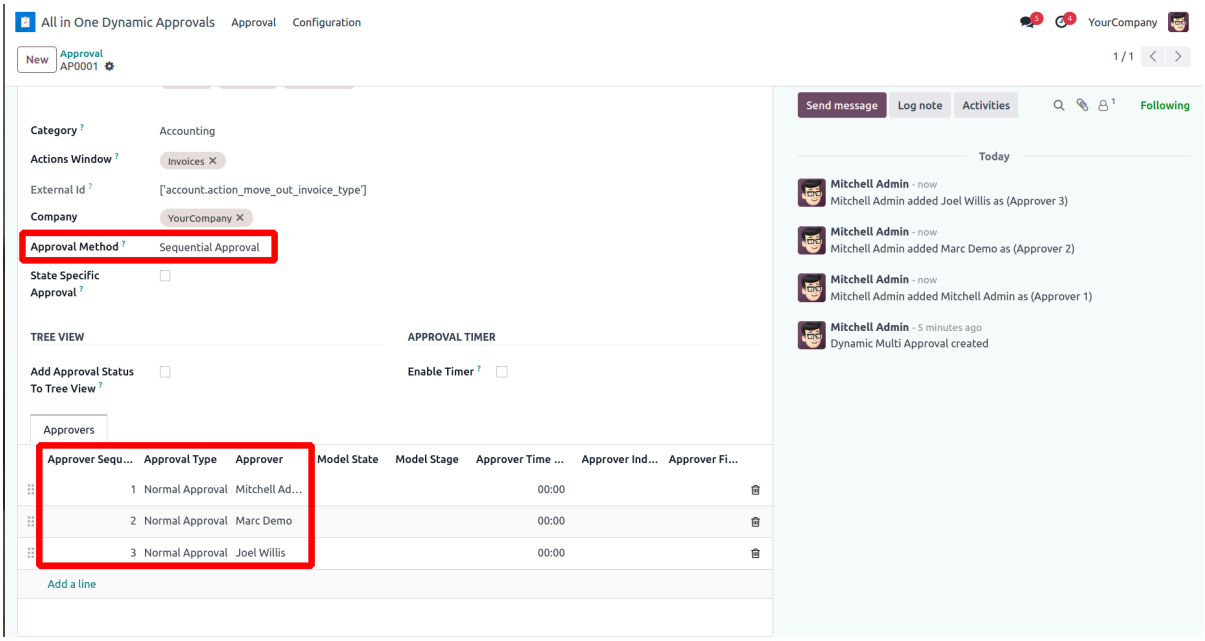

If you choose a multi company check the multi company is enabled and the both company options are ticked. Otherwise the effect is not to get the multi company.

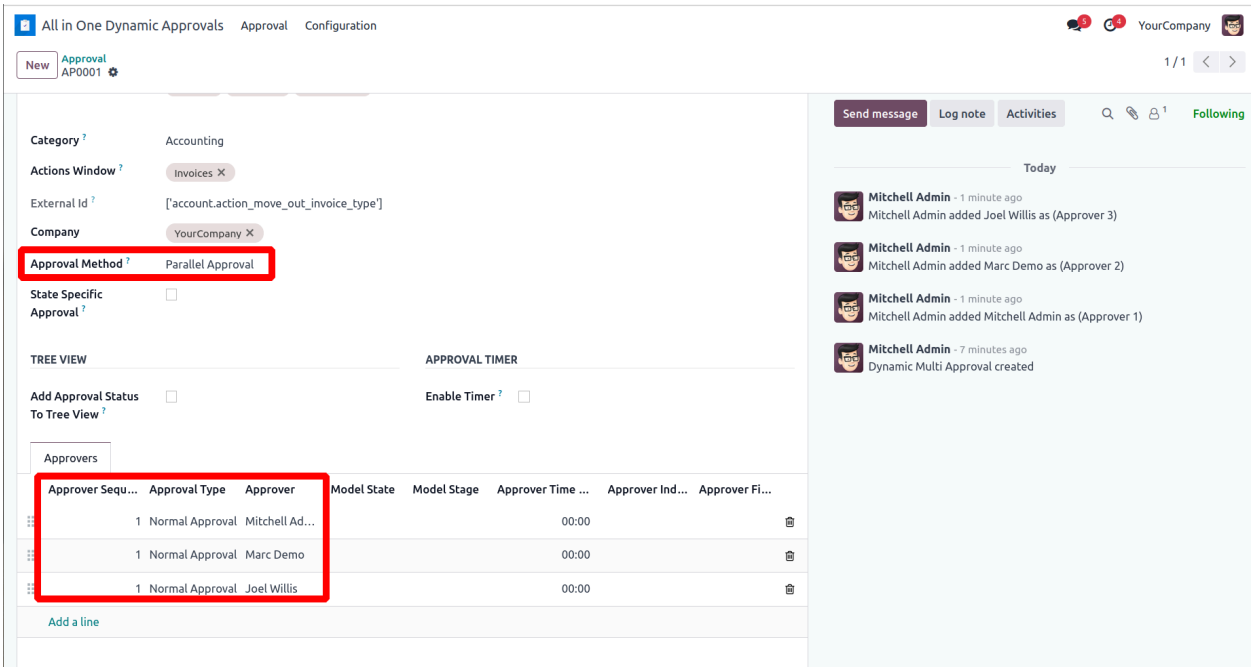

7. Approval Method

Approval method is type selection field with sequential, paralell approval and Employee Hierarchy Approval, Lets see one by one in both cases,

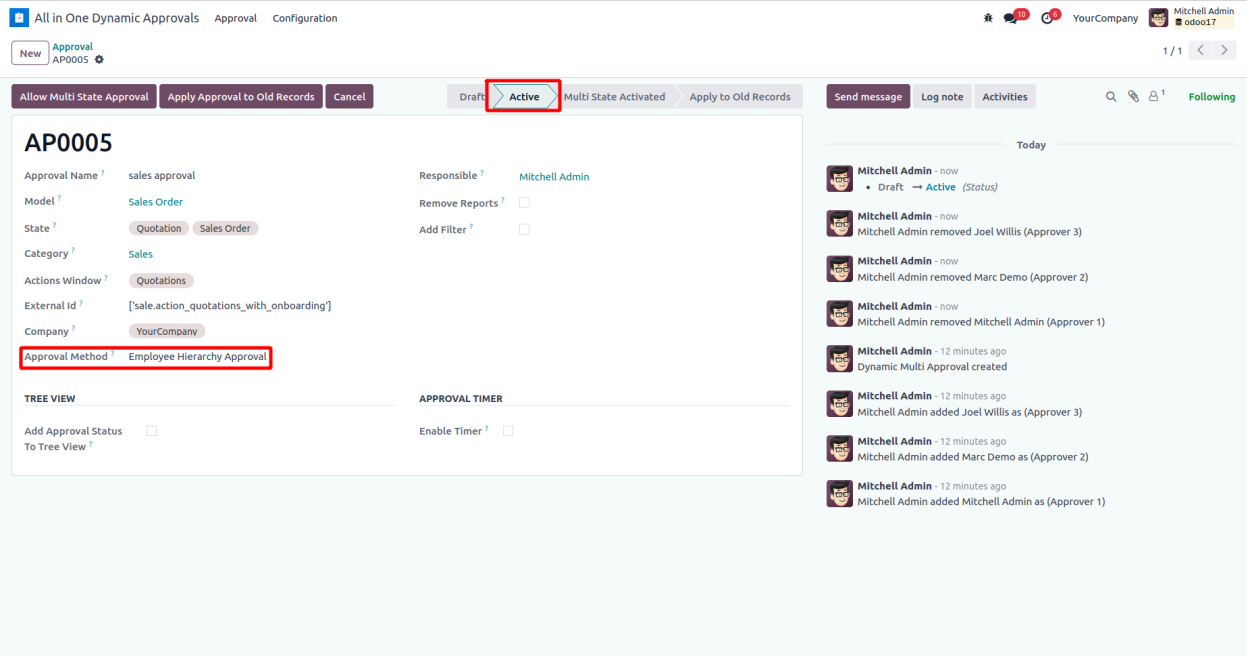

First option is Sequential Approval in which approver will approves the record based on the order of their sequence.

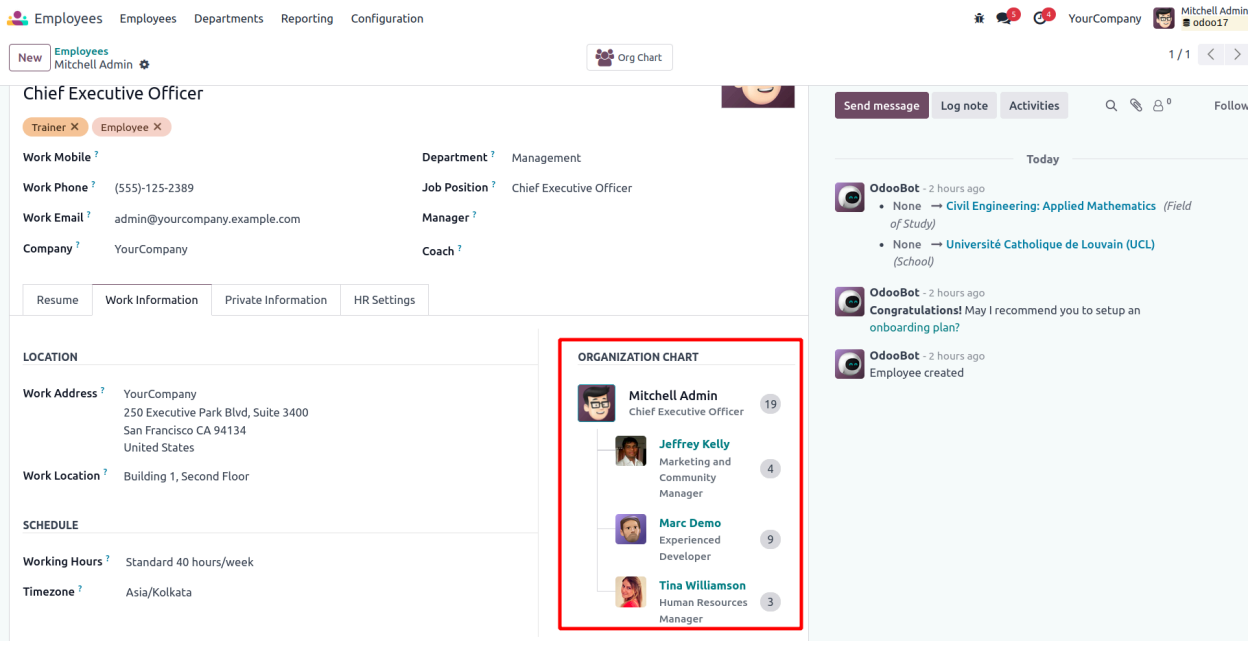

Second option is Paralell Approval in which approver has no specific order for approving the record

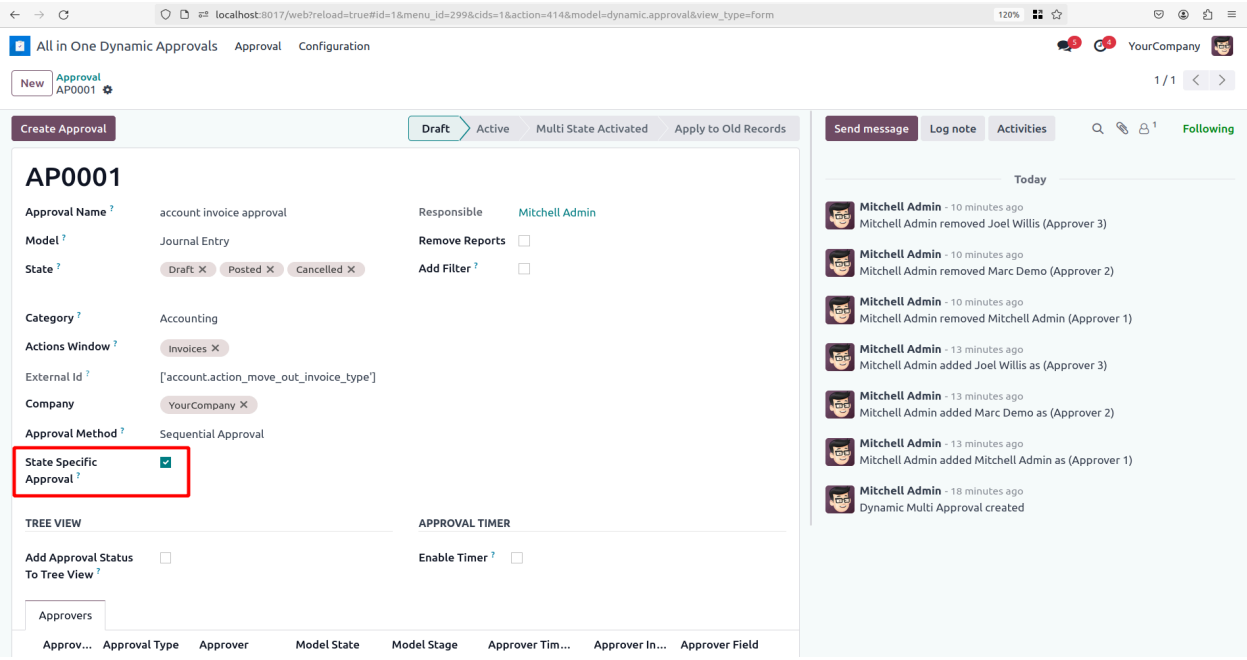

Third option is Employee Hierarchy Approval in which appprovers are set based on the “Organization Chart” of the Corresponding user who creates the record in the approval model.

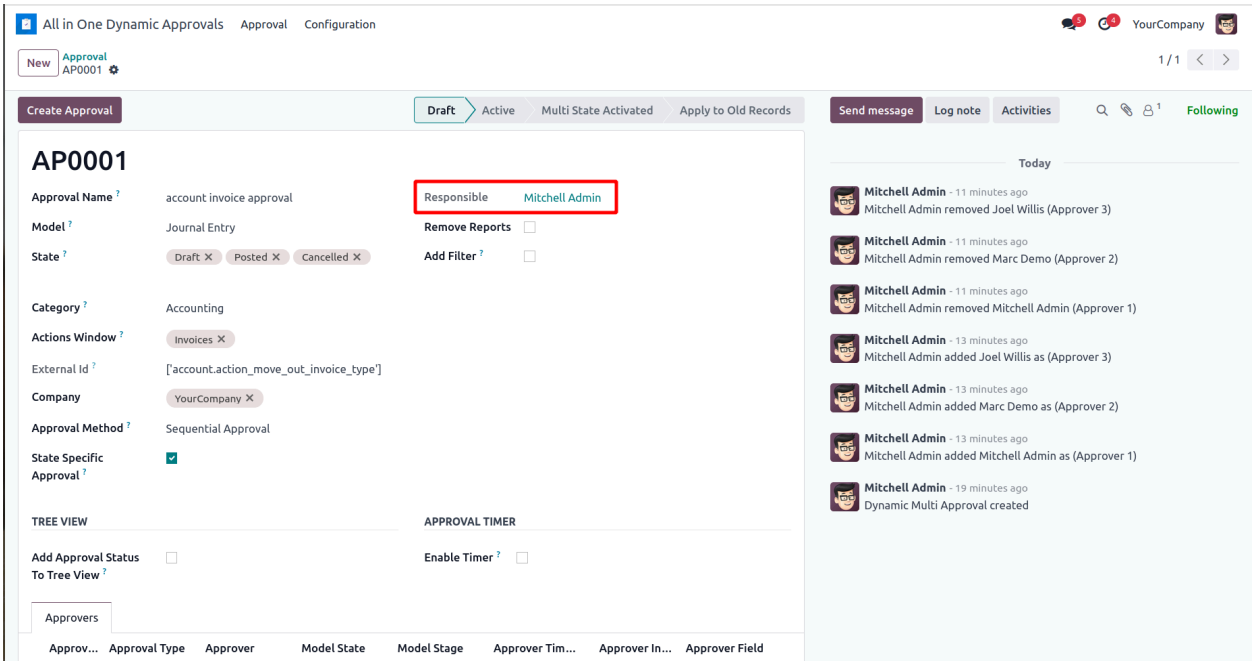

8. State Specific Approval

When this boolean field is checked we can create approval for a model such a way that we can configure approvers for specific state for example if the model is Journal Entry we can set person1 for approval in state draft and person2 approves in state posted.This option will not available if the selected Approval Method is Hierarchy Approval.

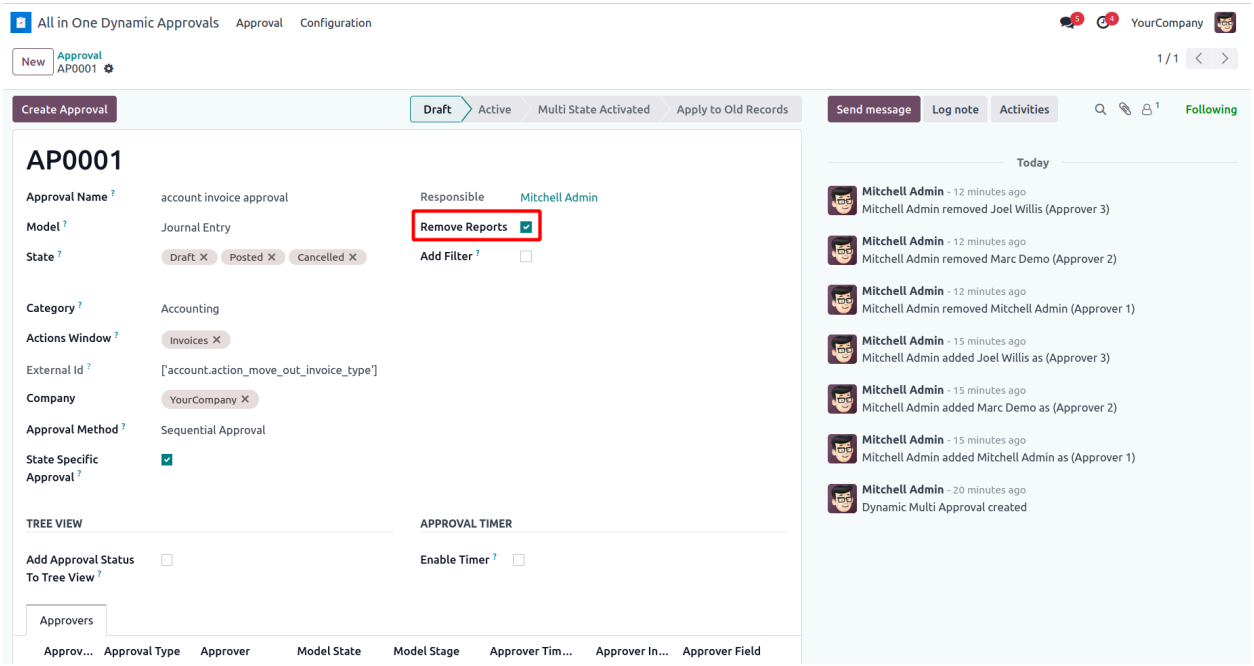

8. Responsible

This field represnts the responsible person of the created approval.

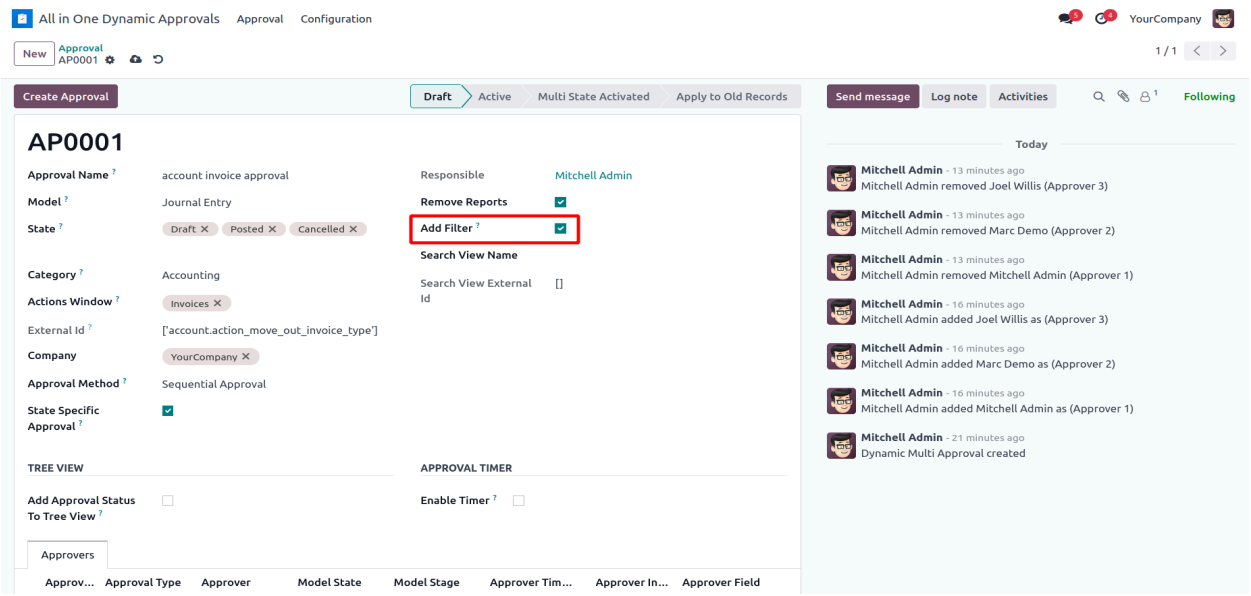

9. Remove Reports.

On enabling this option there will not an option to print the record in the approval creating model.

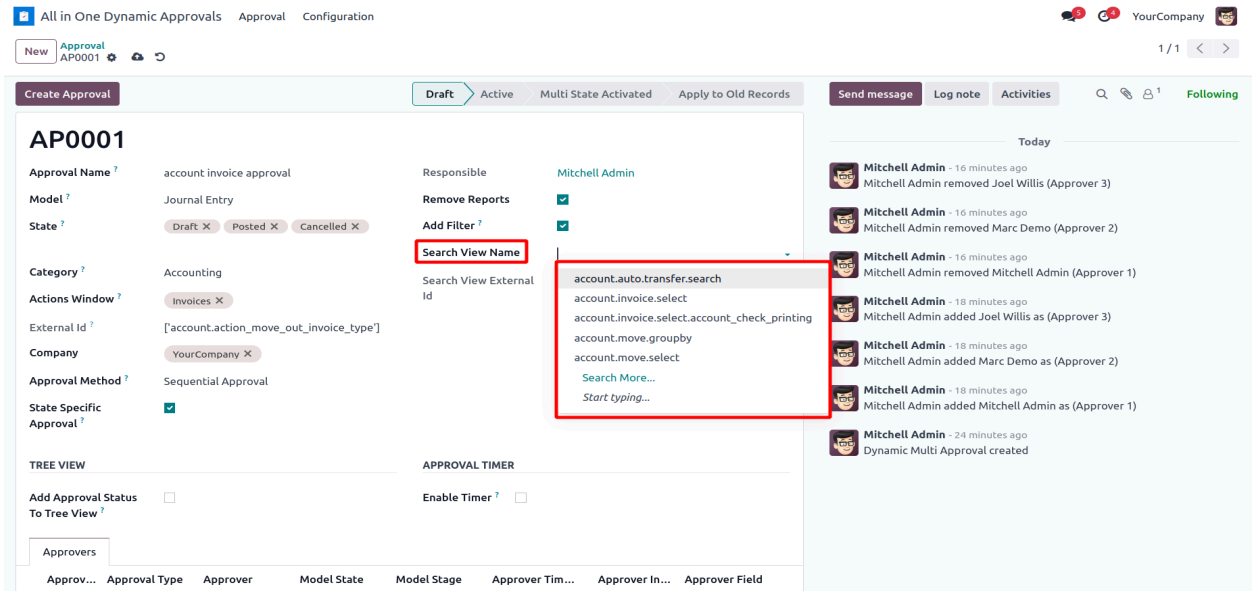

10. Add Filter

If you want to add a filter to the approval creating module .The check box tick time you get another field.

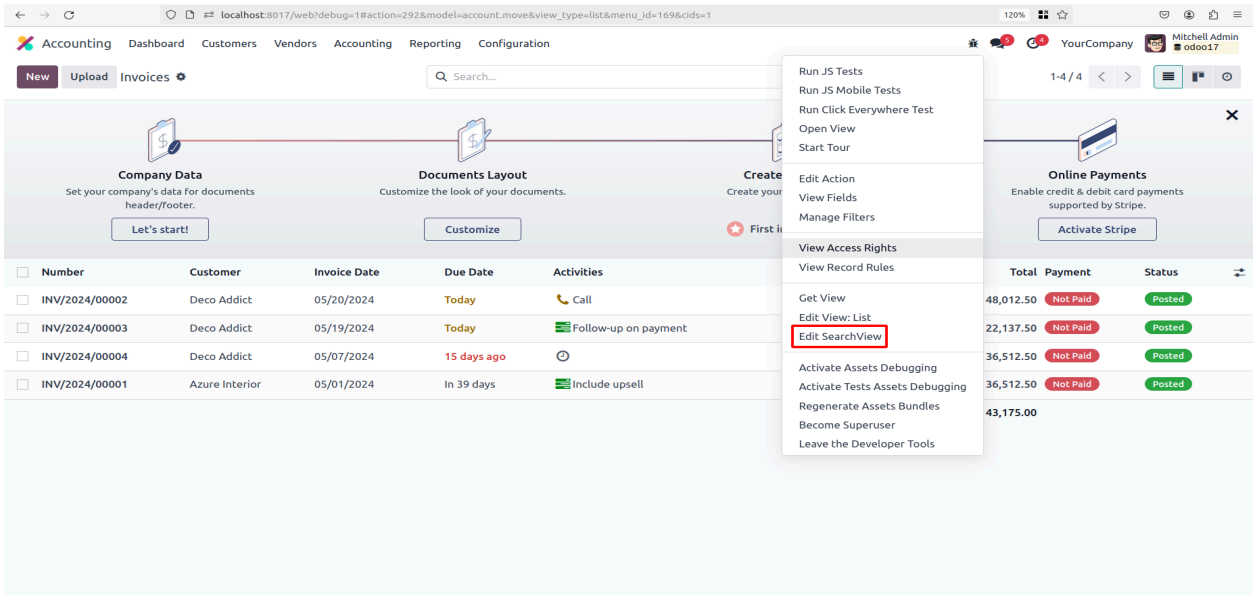

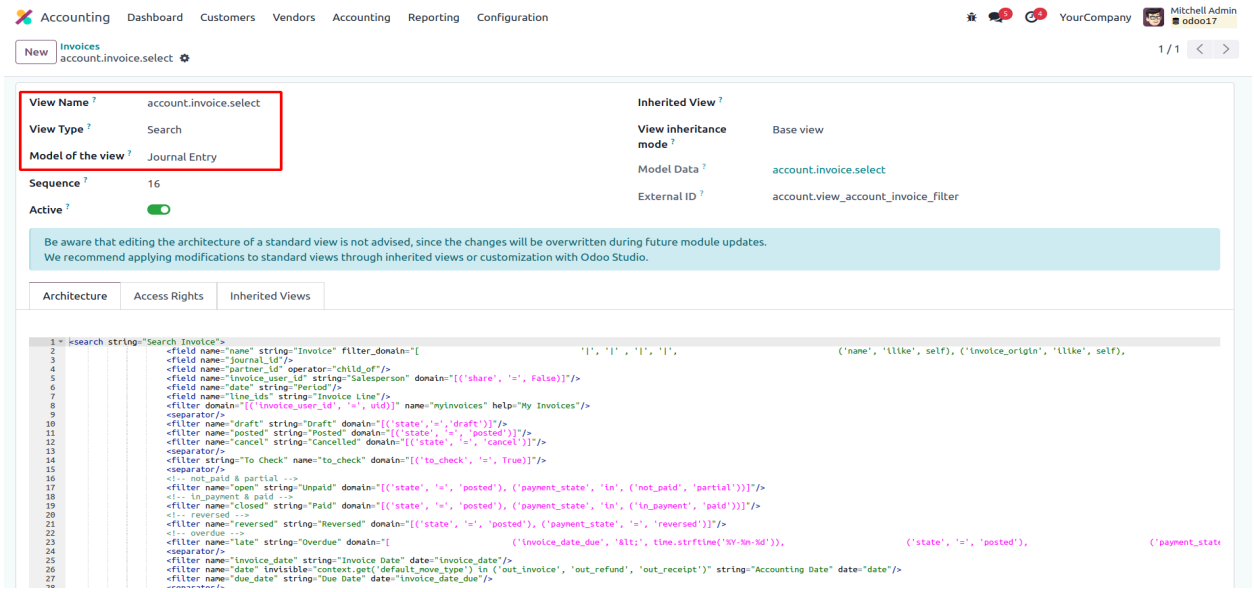

11. Search View Name

Here we needed to add the model search view name. The field will list the available search view names.

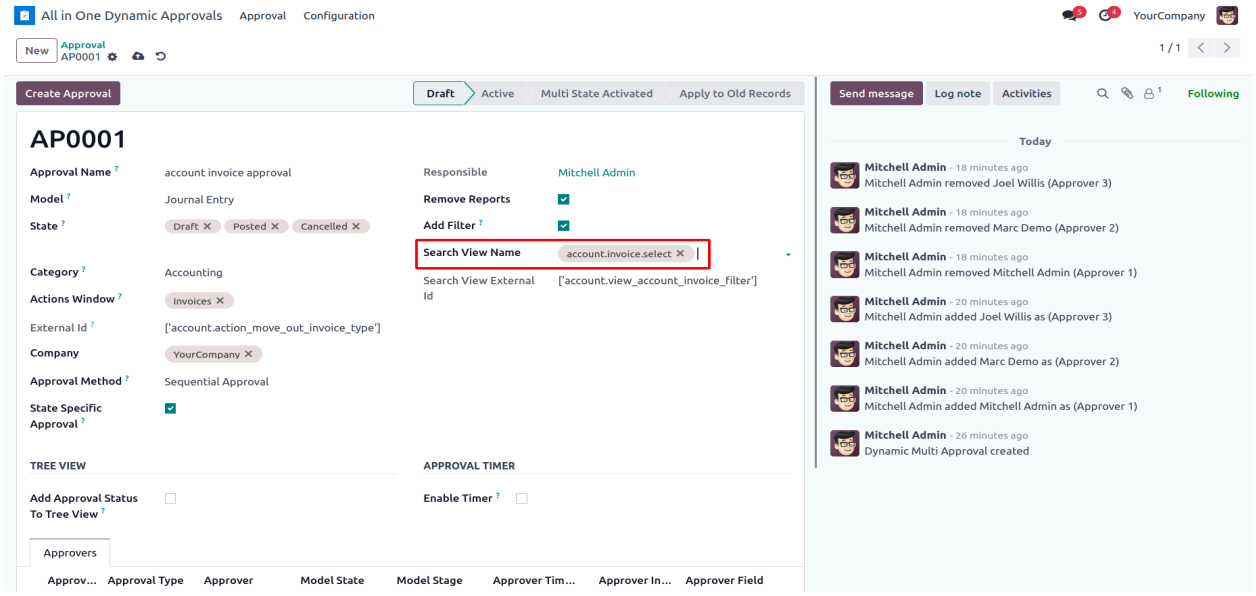

In the list you need to choose your module status displaying a search view . For the value confirmation go to the module and enable debug mode. Then click the debug icon and take the **Edit SearchView** option . Then you get a wizard, In the wizard you can see the View Name**.**

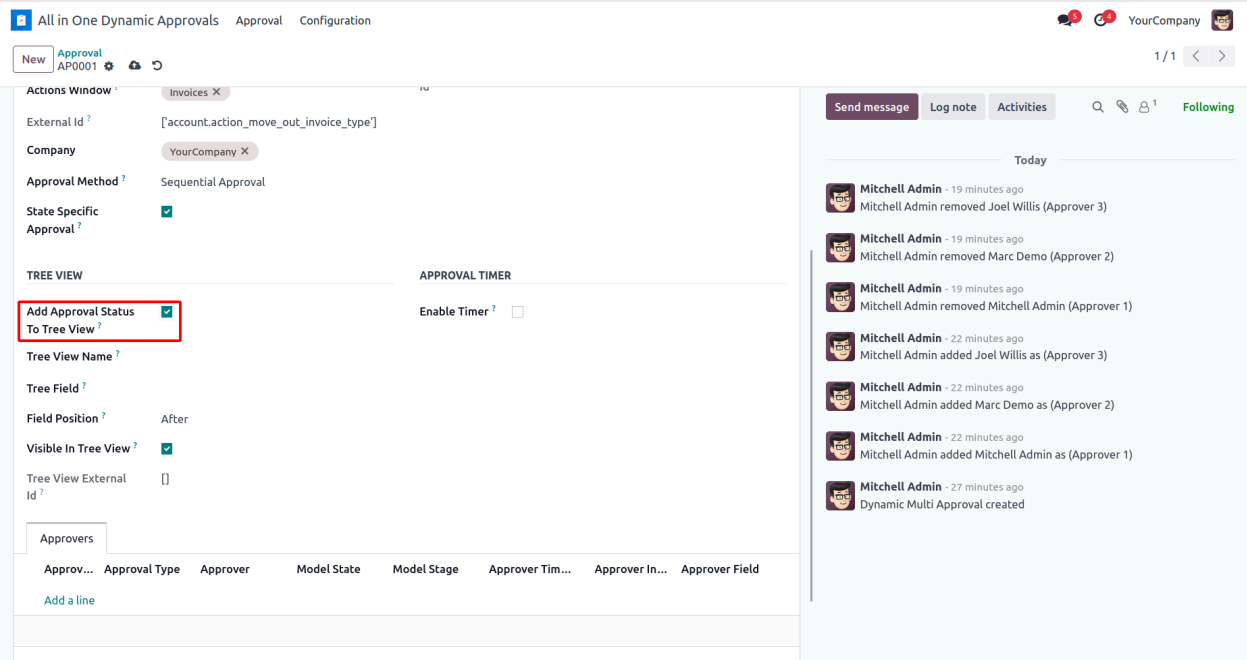

Then the approval creation form choose the module view name in the list.

12. Add Approval Status To Tree View

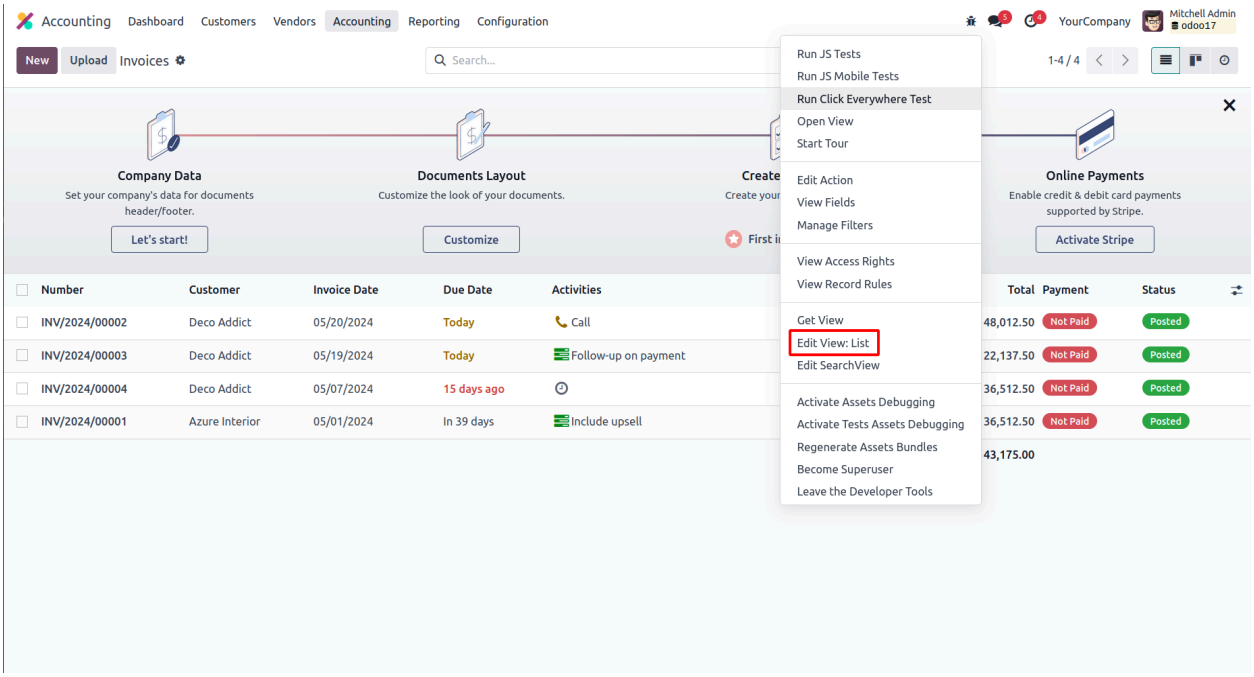

If enabled the approval status of the records will be visible in the list view of approval module.

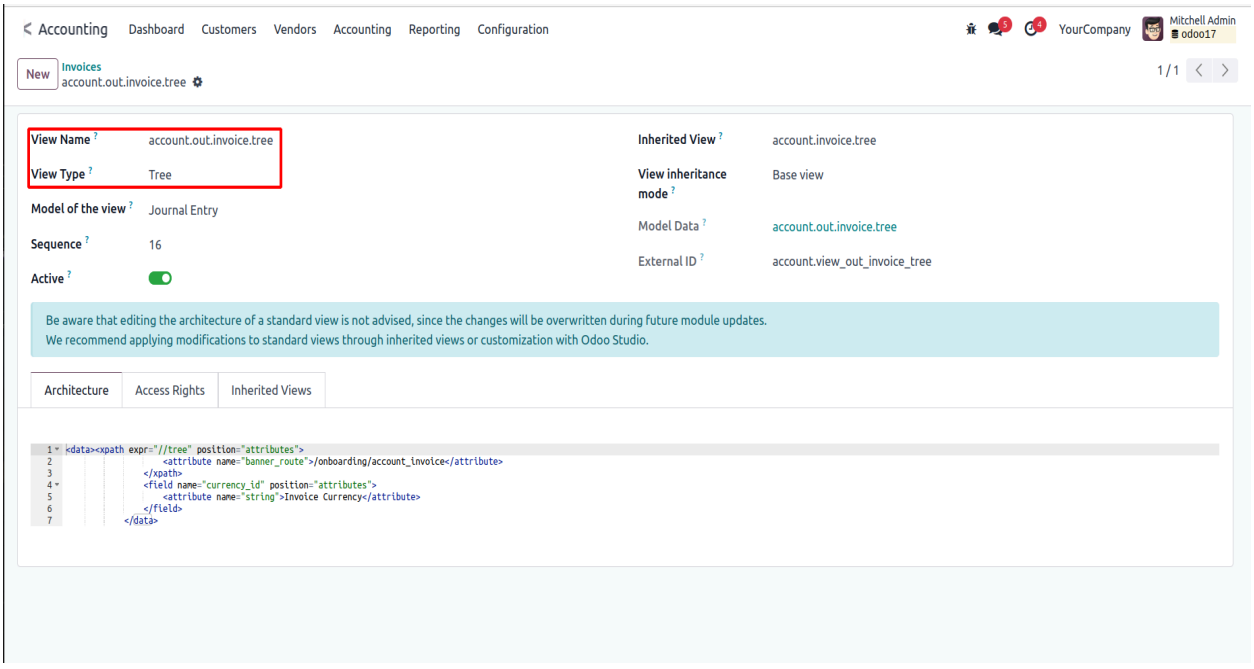

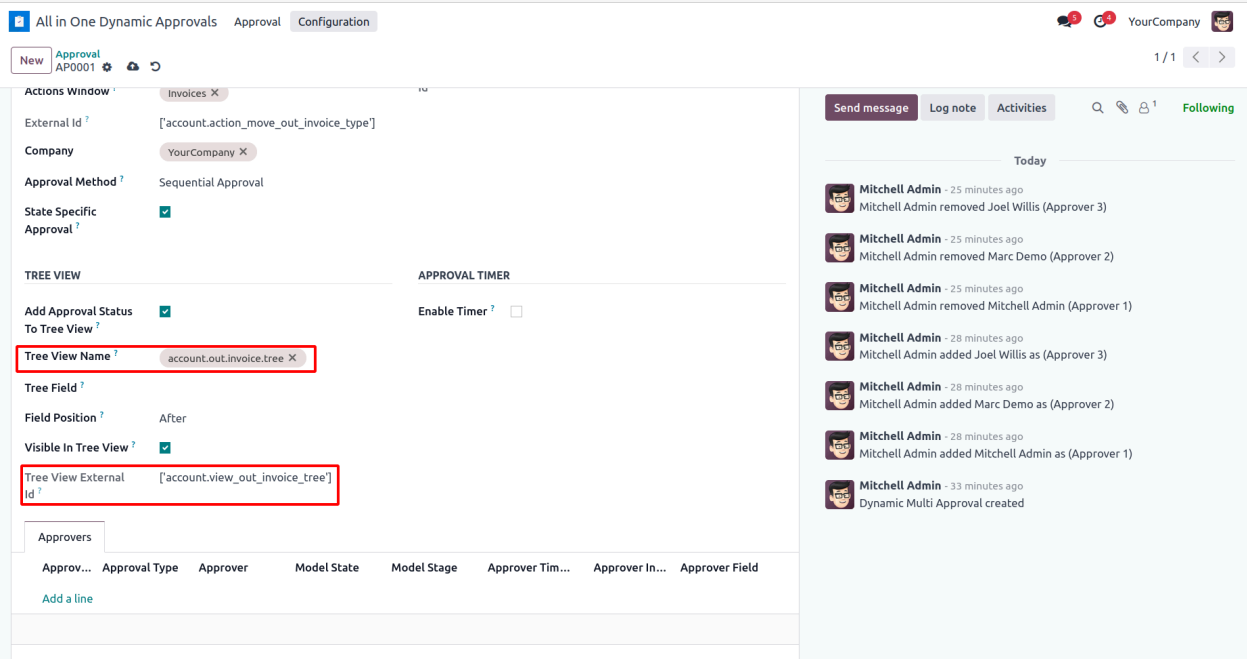

13. Tree View Name

Choose the appropriate tree of the appproval creating module for the approval status, let's have a look have to select the exact tree,

For the value confirmation go to module and enable debug mode. Then click the debug icon and take the **Edit View List** option. Then you get a wizard you can see the View Name.

14. Tree Field

Here in this Many2one field we can choose one the field in the selected tree view to set the position for the approval status.

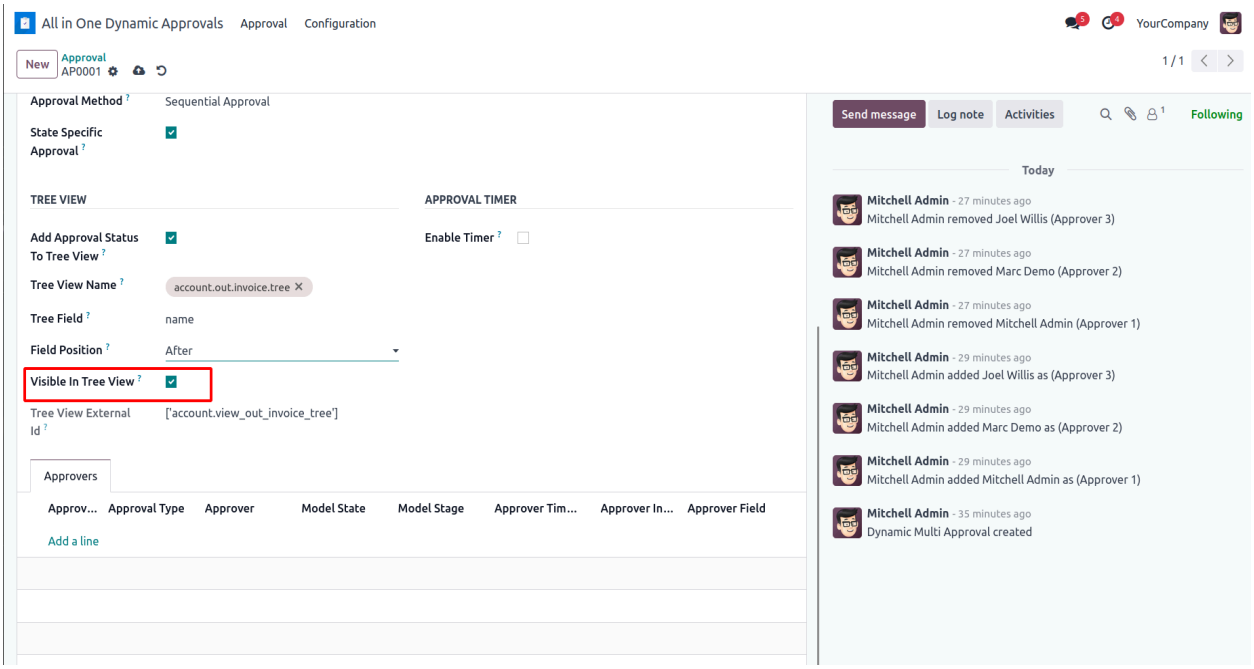

15. Field Position

Selection field of values after and before, select any of the one to set the position of the approval status field in the approval creating modules tree view.

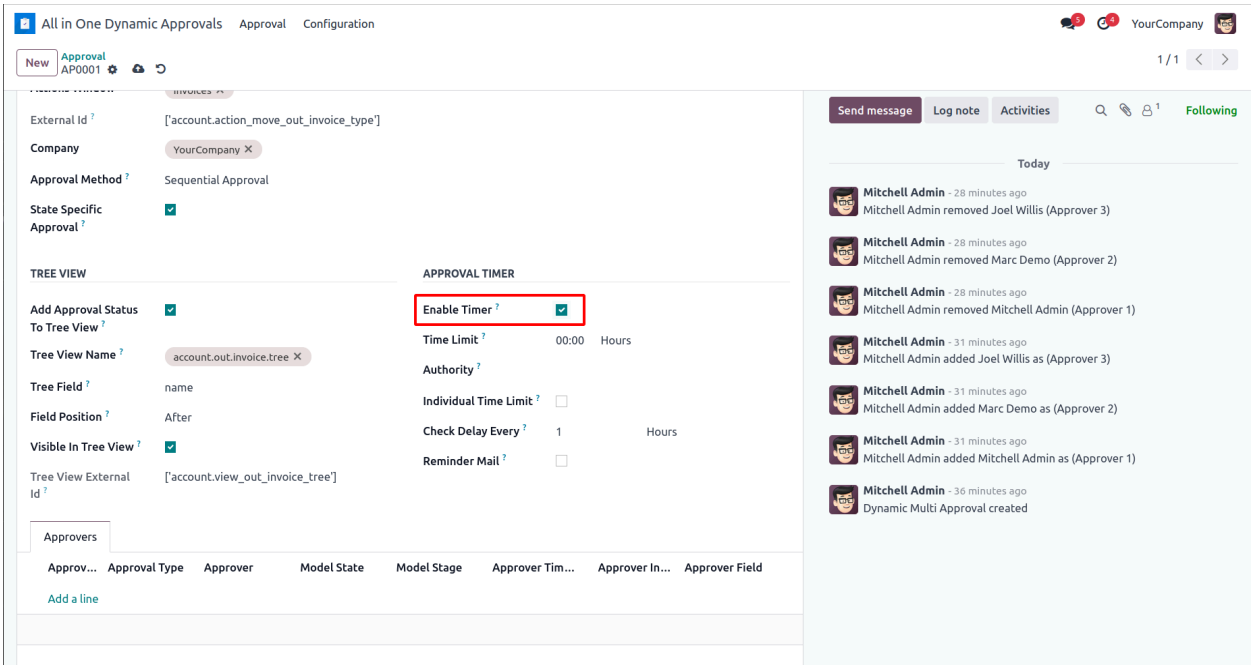

16. Visible In Tree View

This field if enabled make the approval status in the tree view of approval module to optional hide, if enabled it is visible in tree if not we have to toggle to view the field in tree view.

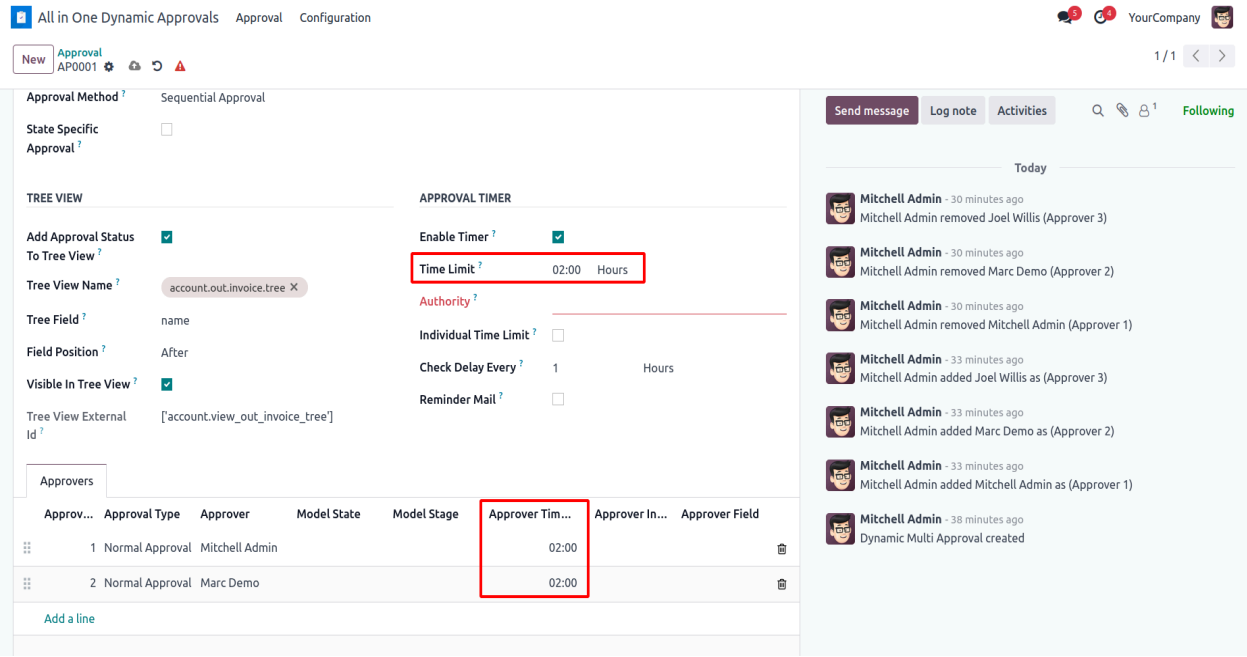

17. Enable Timer

Enable this field to enable time limit for approvers for approving the approvals.

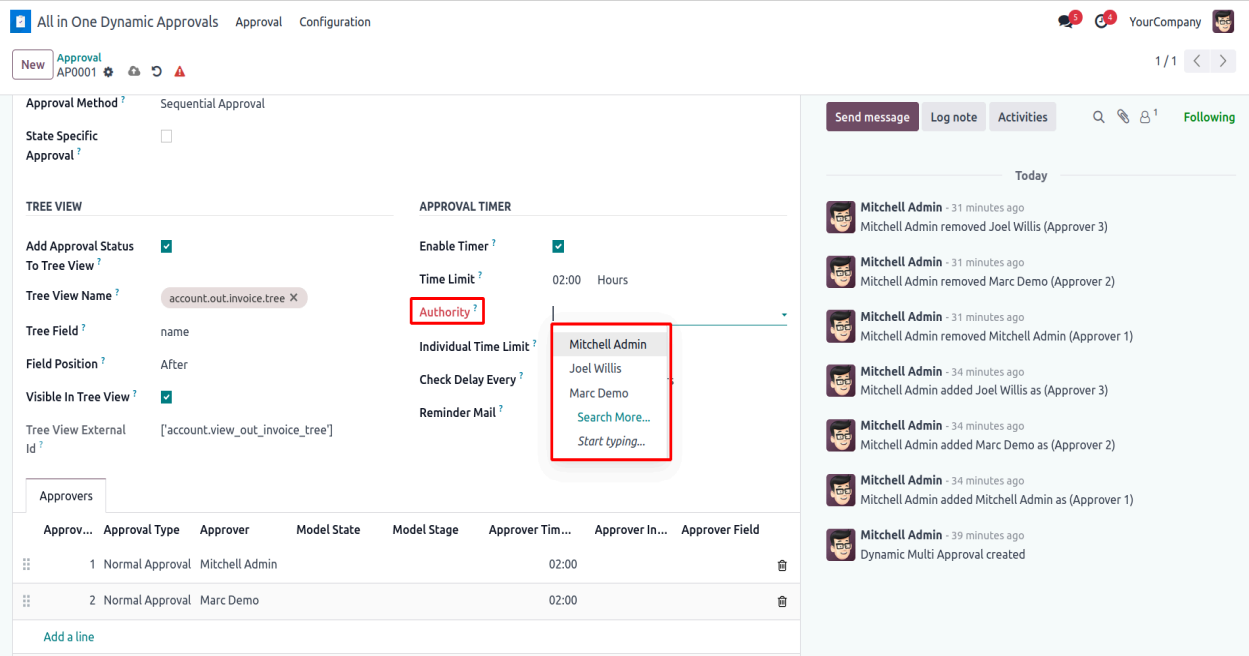

18. Time Limit

Set common time limit for all the approvers in current approval record.

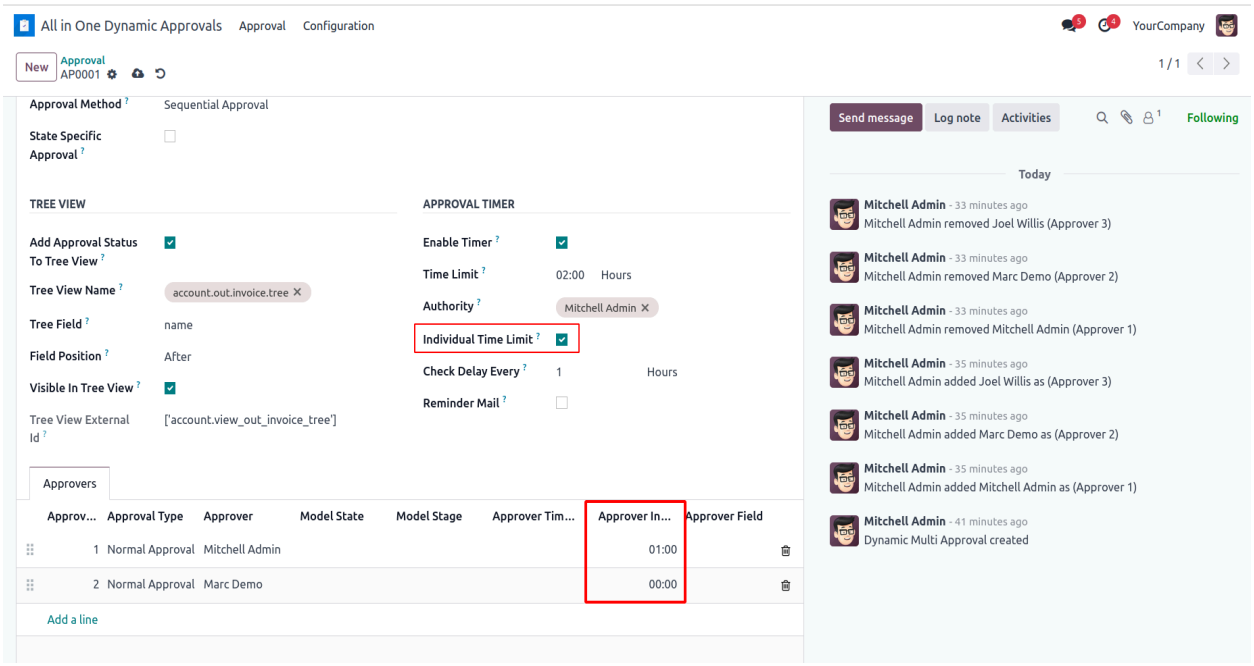

19. Authority

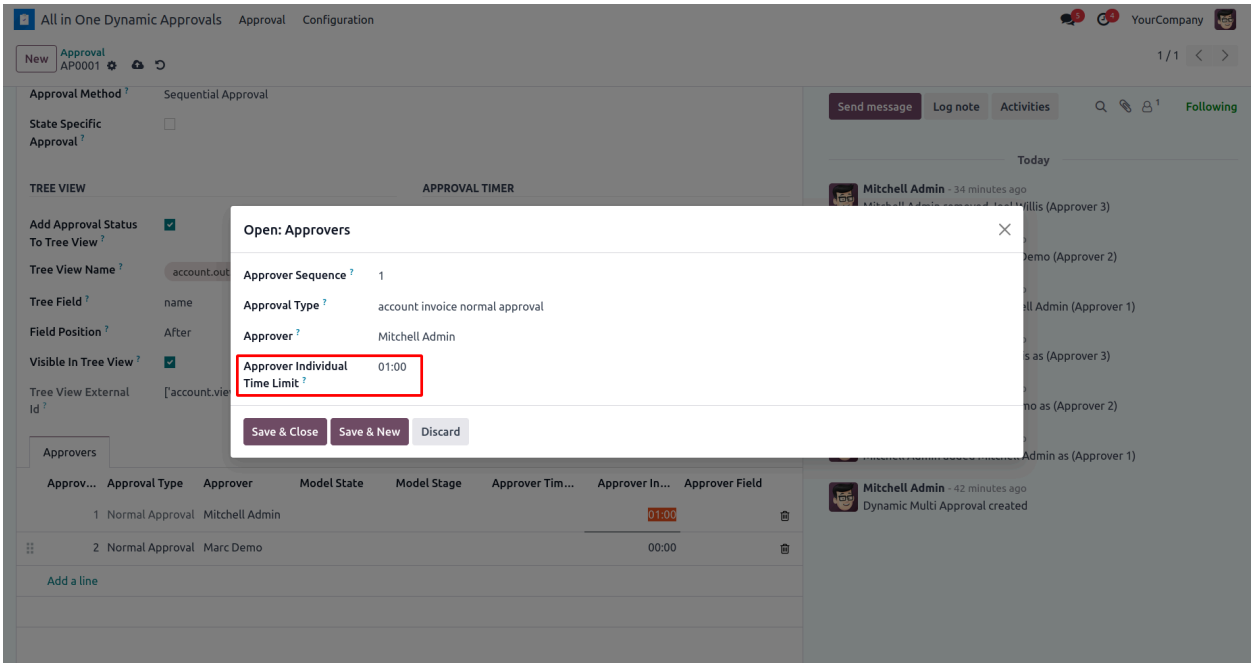

Set authority person for the Approval Timer to sent emails notifications when the approval request id delayed by the approvers.

20. Individual Time Limit

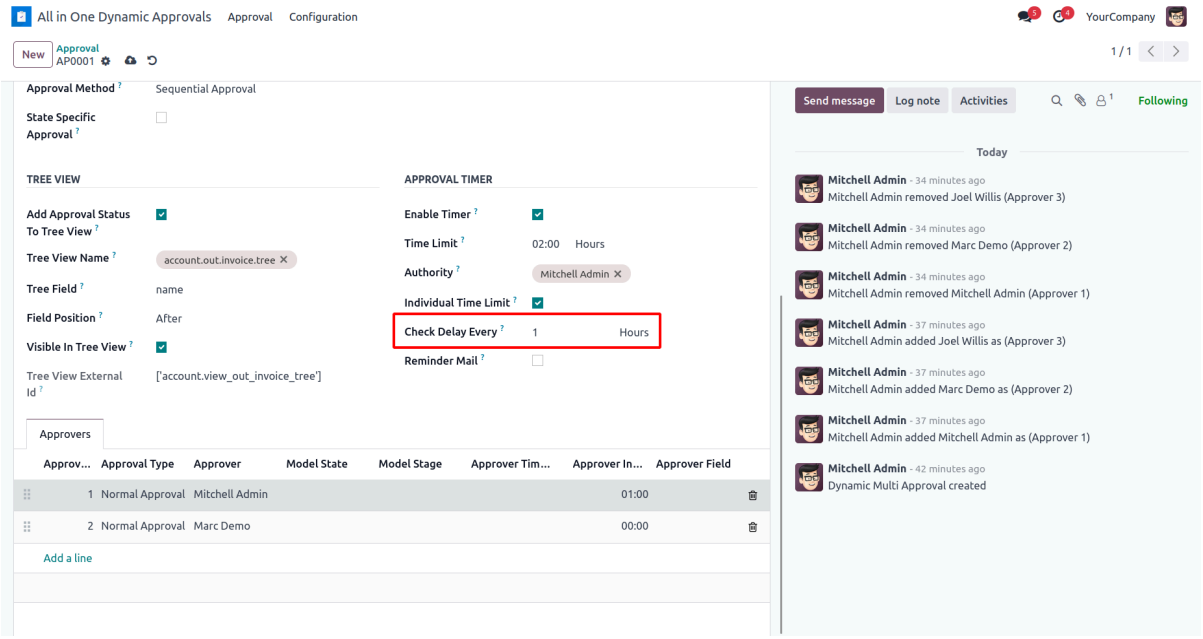

If this option in enabled we can set individual time limit for the approvers to approve the approval request.

21. Check Delay Every

This numeric field triggers the cron job every specified interval in this field to check the delay of any approval request.

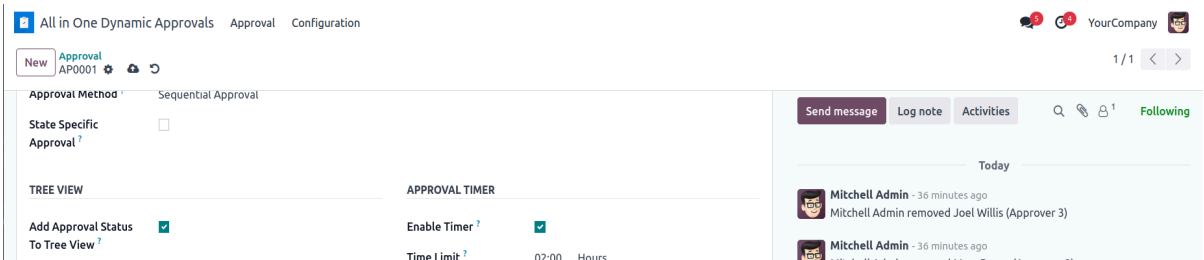

22. Delay Type

This selection field with values minutes, hours, days, weeks delay the approval request delay with the **Check Delay Every** fields value.

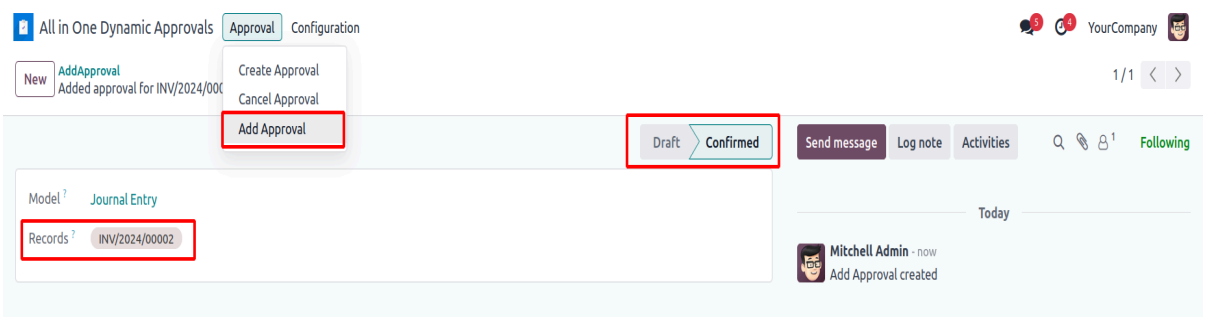

23. Remainder Mail

If enabled remainder mail will be sent to the approvers if they haven't approved the approval request.

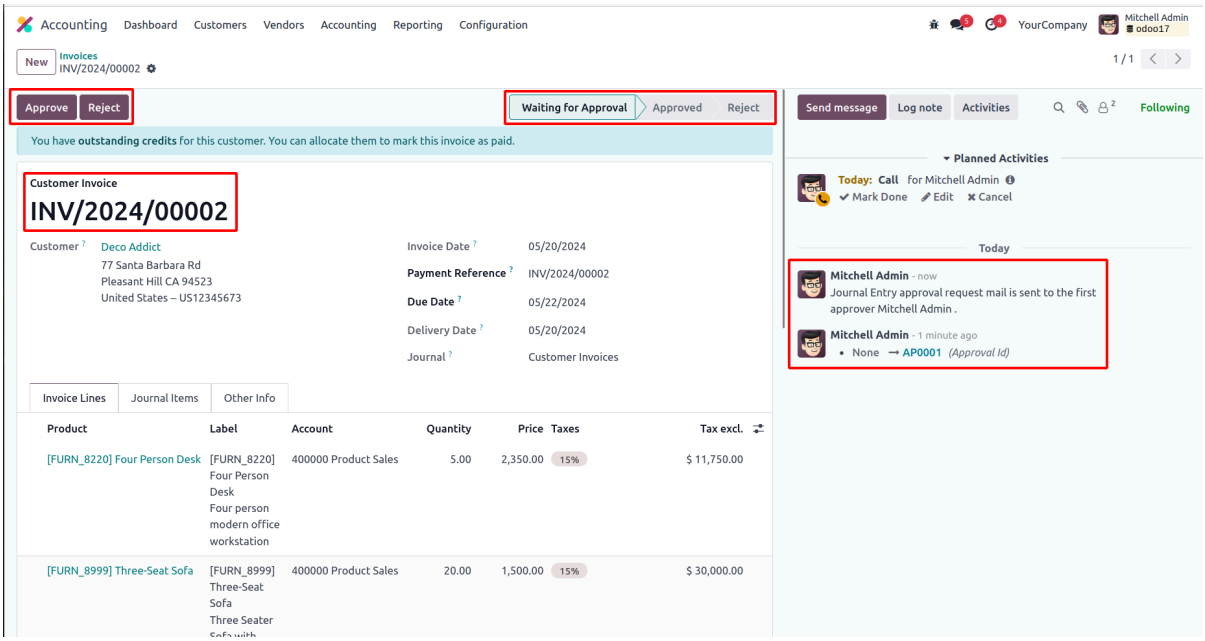

ADD Approval

For adding appprovals to individual records of approval created model got to menuitem click **Add approval** then click new button select model in the model field and select the record to set approval to that record.

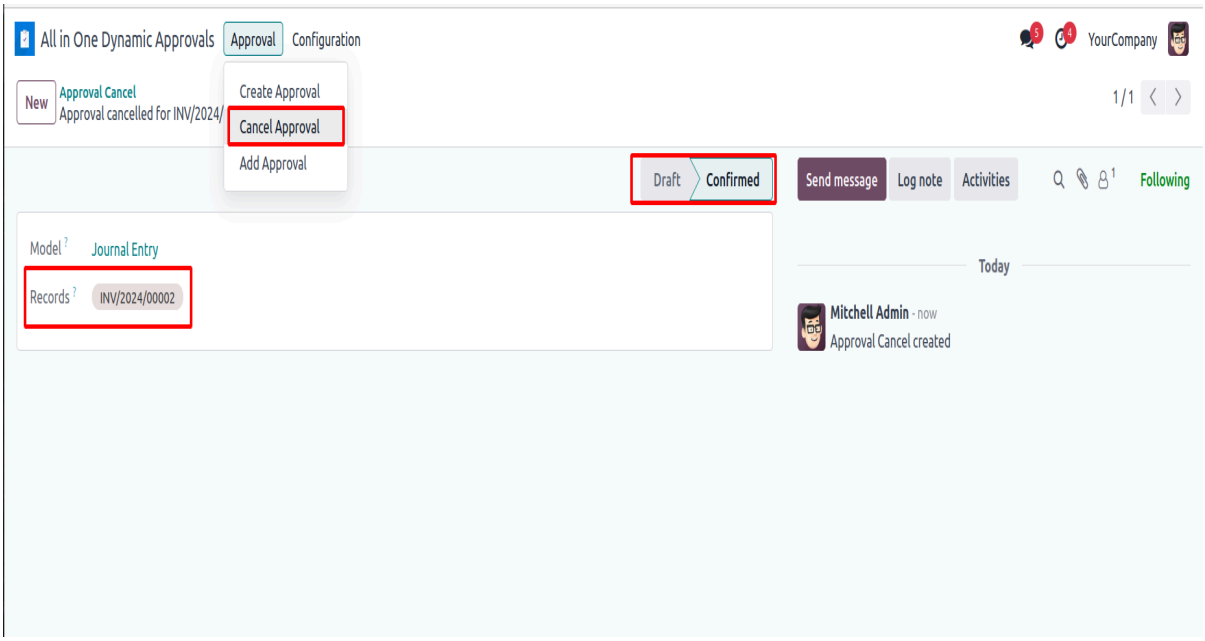

After clicking the confirm button the approval is succesfully set to that record. If we go and open that record we can see a from mentioned below.

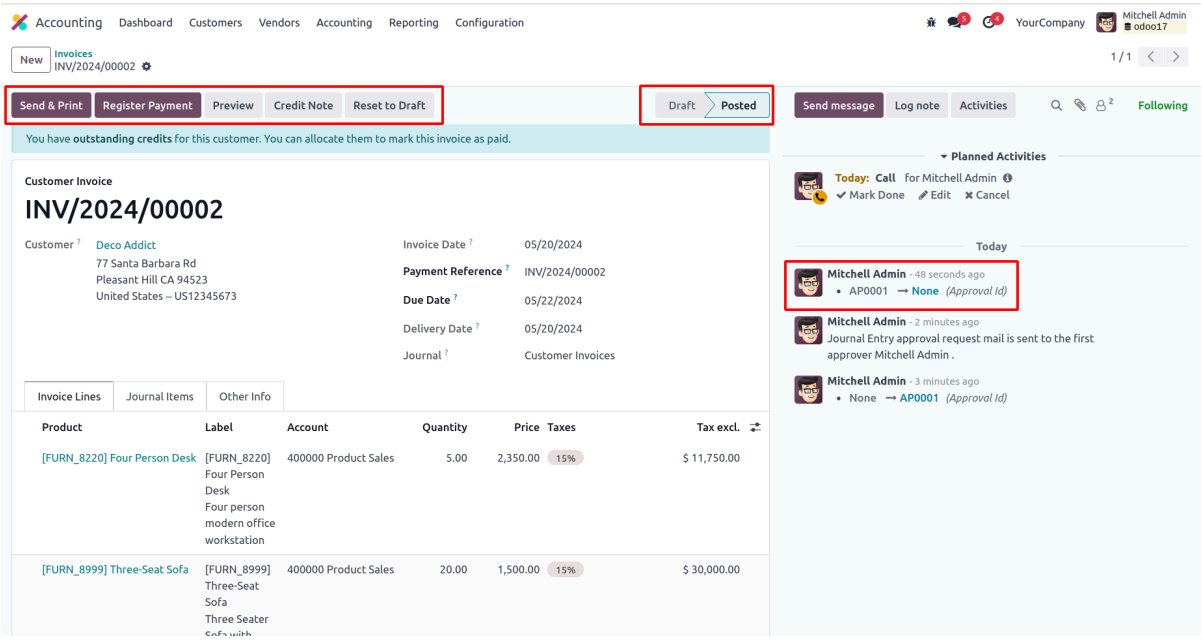

Cancel Approval

For cancel appprovals to individual records of approval created model got to menuitem click **Cancel approval** then click new button select model in the model field and select the record to cancel approval of that record.

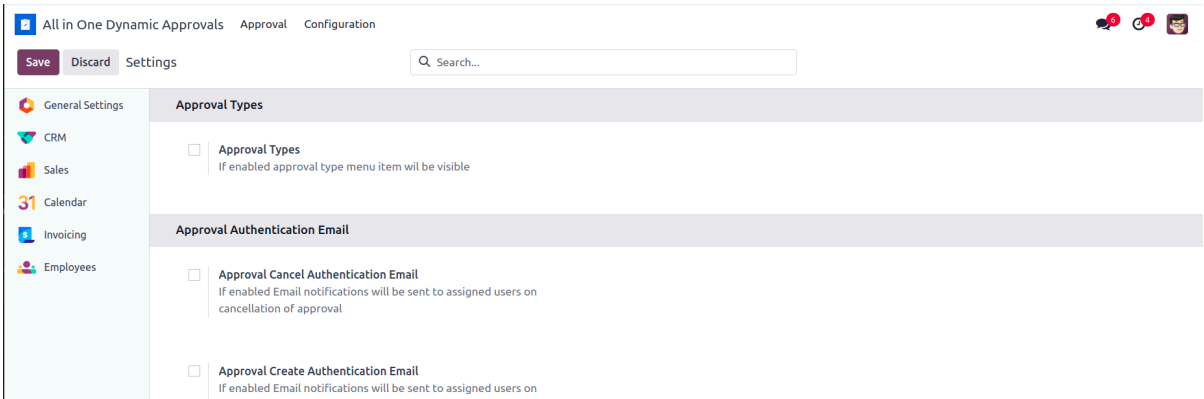

After clicking the Cancel Approval button the approval is cancleled for the selected record. If we go and open that record we can see a from mentioned below.

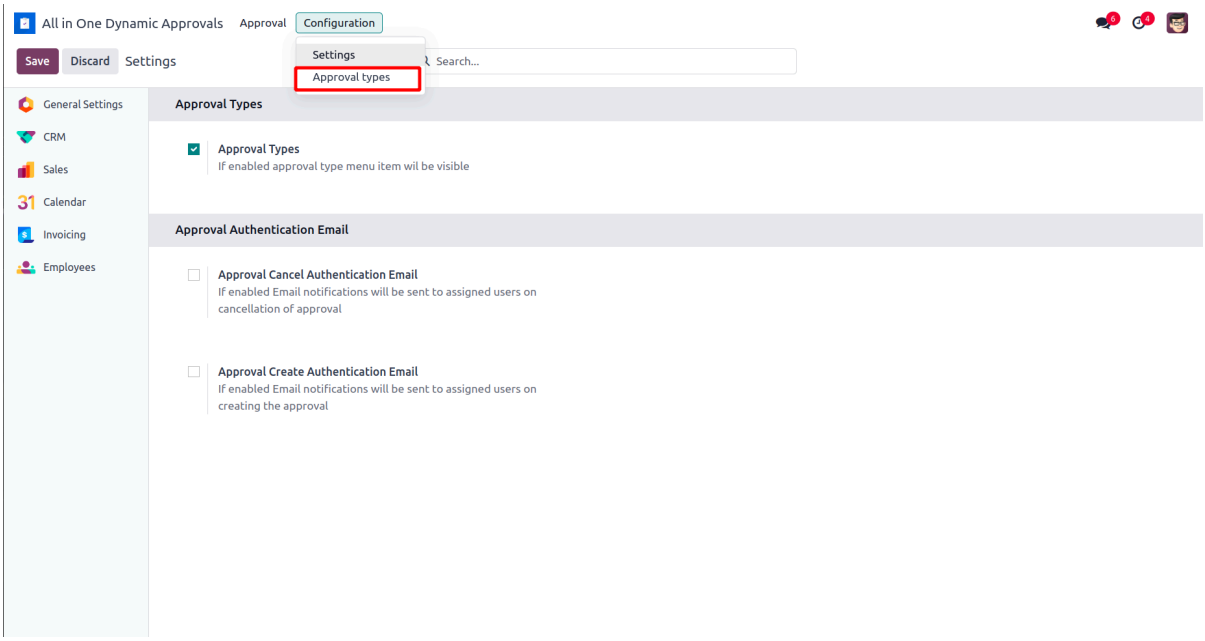

Configuration

Under the configuration tab we have settings menu, below shows the configuration of menuitems and form view of settings.

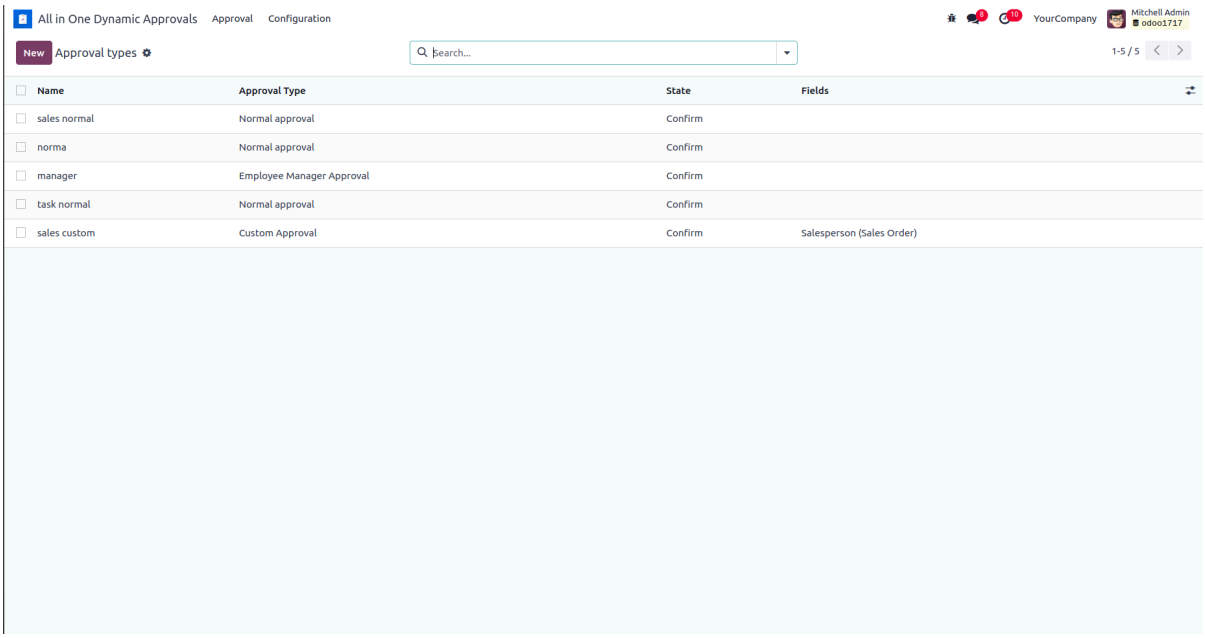

Approval Types

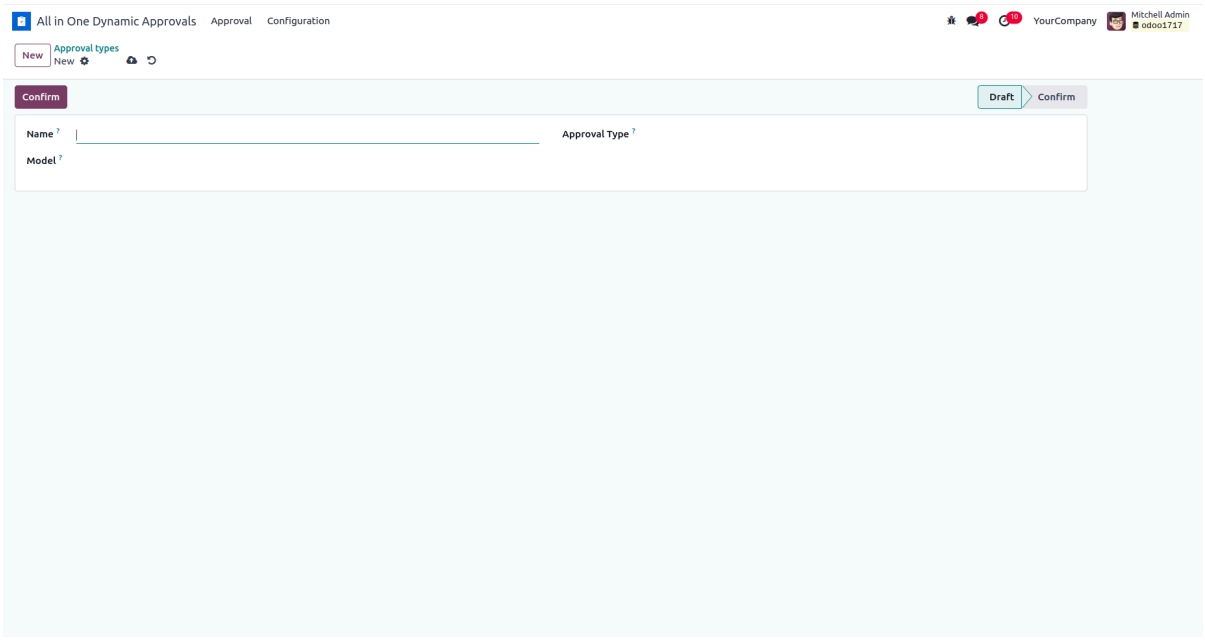

On enabling the approval type new menuitem **Approval Types** will be visible under configuration menu tab. In the V17 version we can configure different types of approval. Normal Approval with approver as selected user, Custom Approval on selecting the a field in the approval creating module approvers will be determined based on value of that selected field and Manager Approval with approver will be the manager of the user who creates the record in the approval module.

On clicking the **Approval Types** we can see a list view of the created records

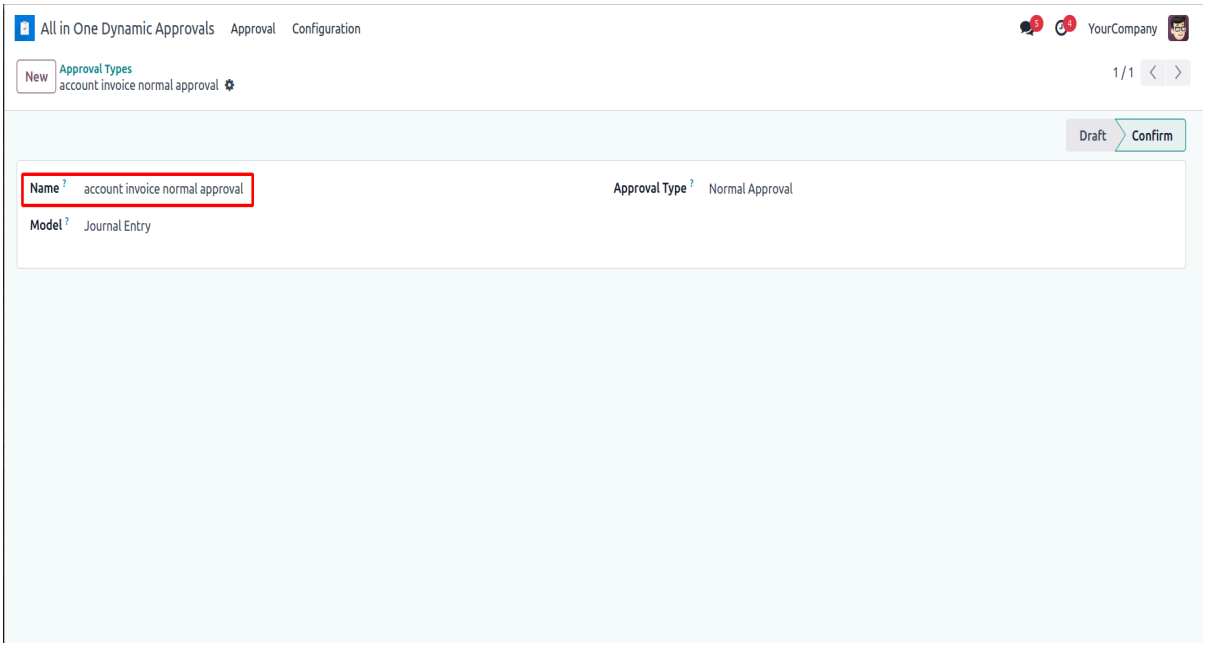

On clicking the new button a new form mentioned below will be visible here

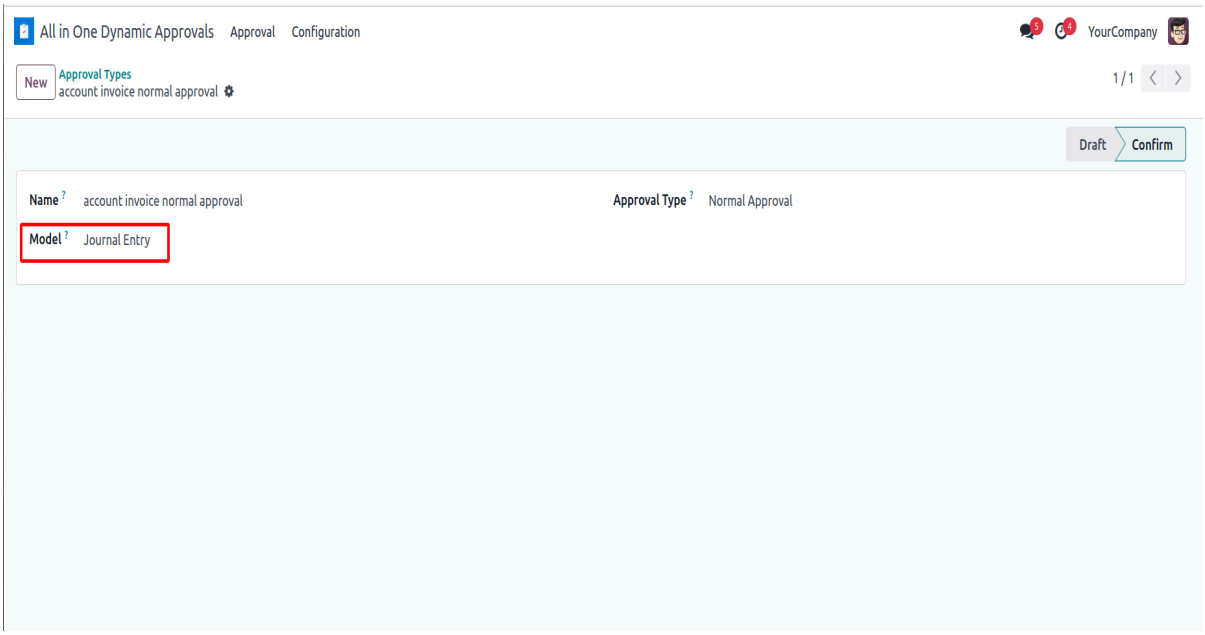

1. Name

Name field of the approval creating approval type.

2. Model

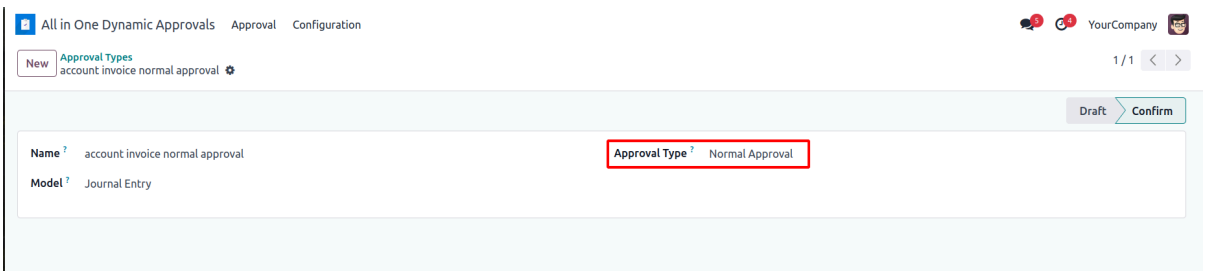

Choose the model in which the approval type is creating.

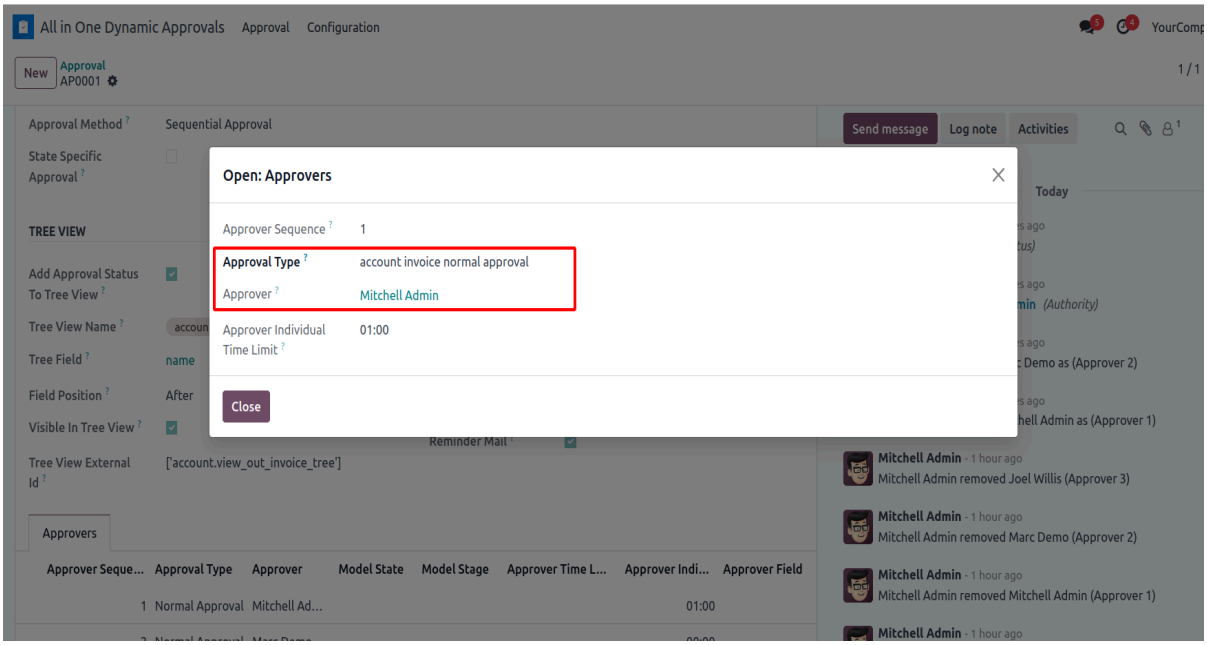

3. Approval Type

Approval Type selection field with values **normal, custom, manager**.

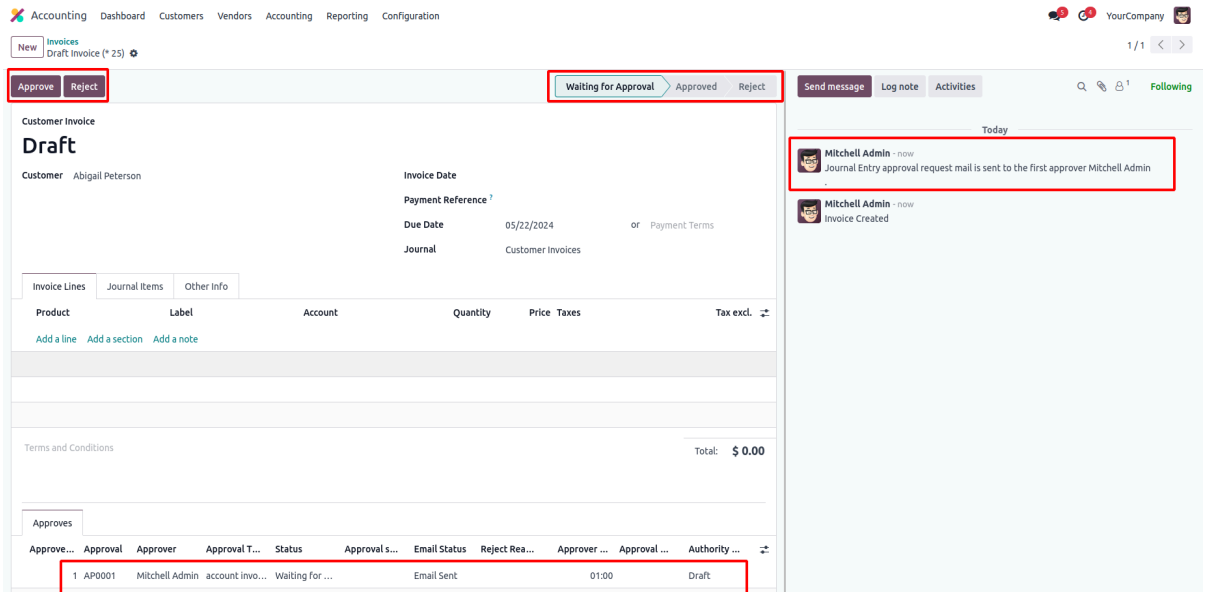

1. Normal Approval

If selected option is normal and we confirms the approval type we can select the approval type when we are choosing the approvers in the **Approvers page** on creating approval record, given below in the view.

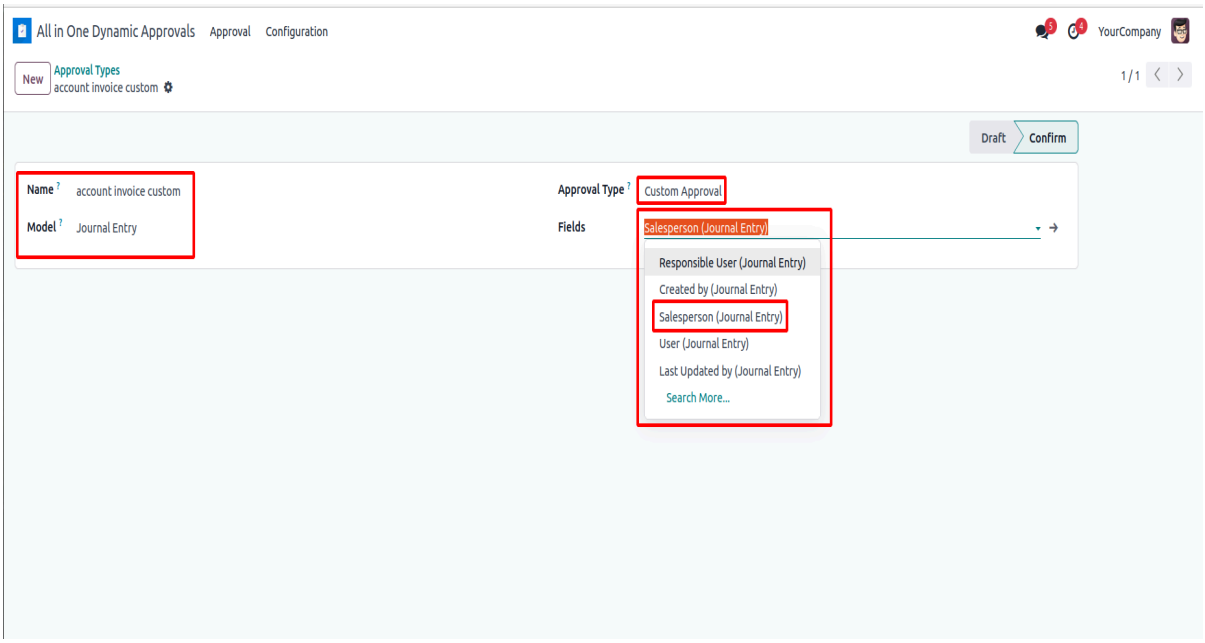

In normal approval we can choose the approver in the Approver field. After creating the approval with approval type as normal and approver as mitchell admin let's see a record in the Journal Entry.

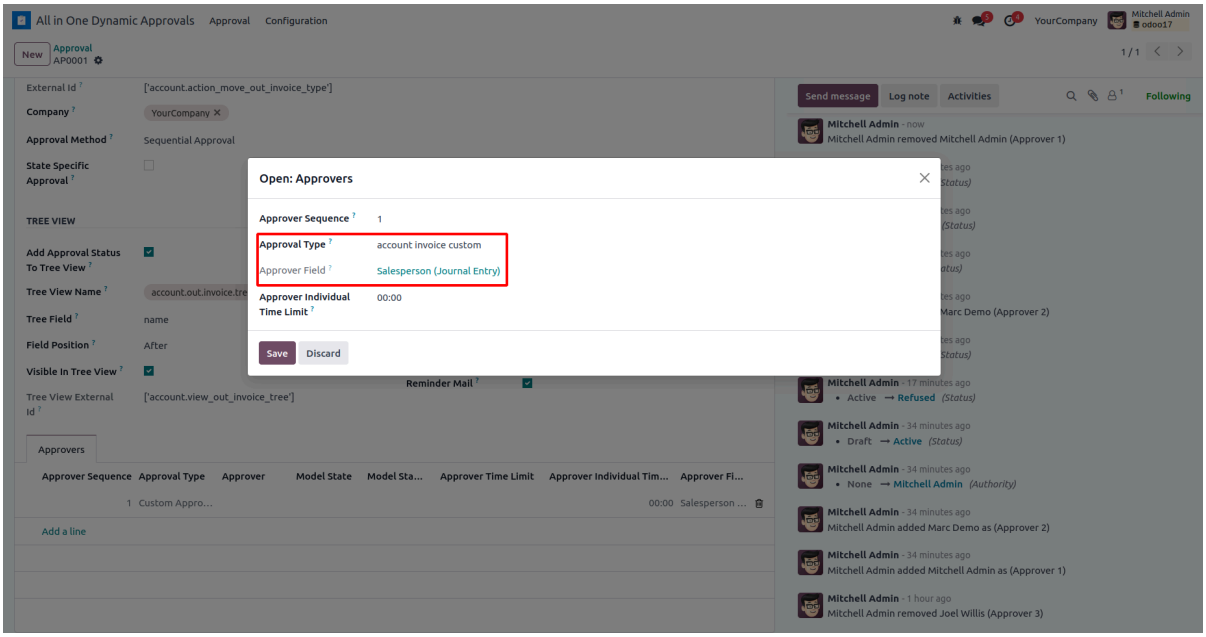

Here we can see approval type as sales normal and approver mitchell admin.

2. Custom Approval

If we choose approval type as **custom** from the selection field , we can see new field **Field** will be visible in the form, from which we can choose an appropriate field.

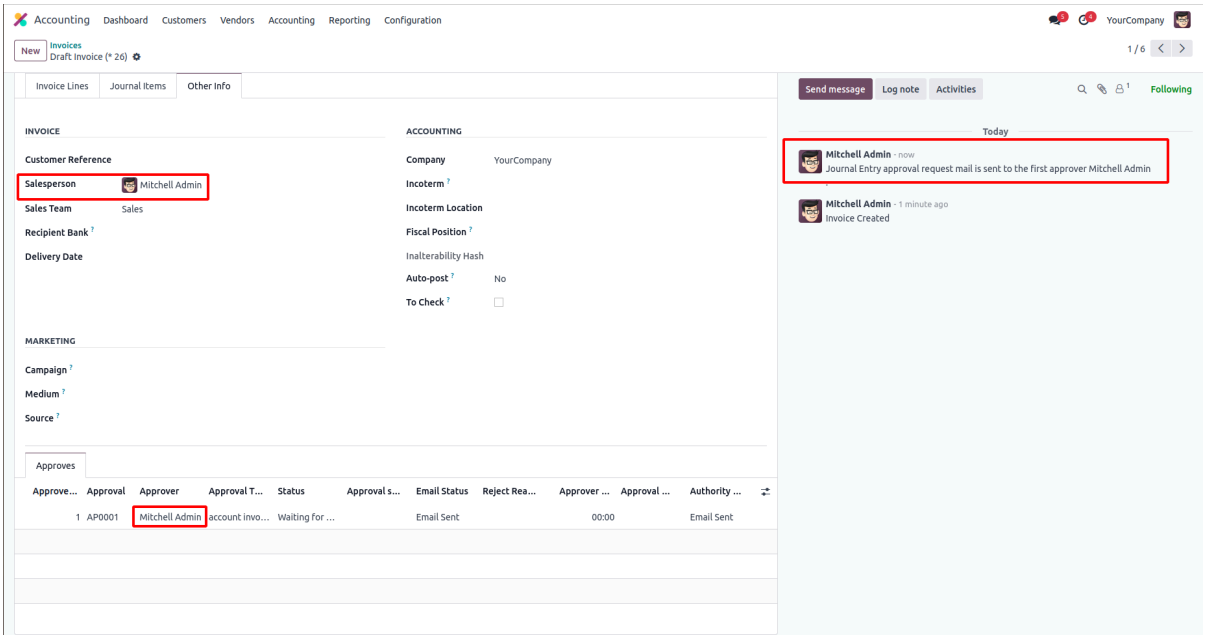

After selecting sales person field and confirming the approval type , we can select the approval type in **Approvers** page in approval creation from.

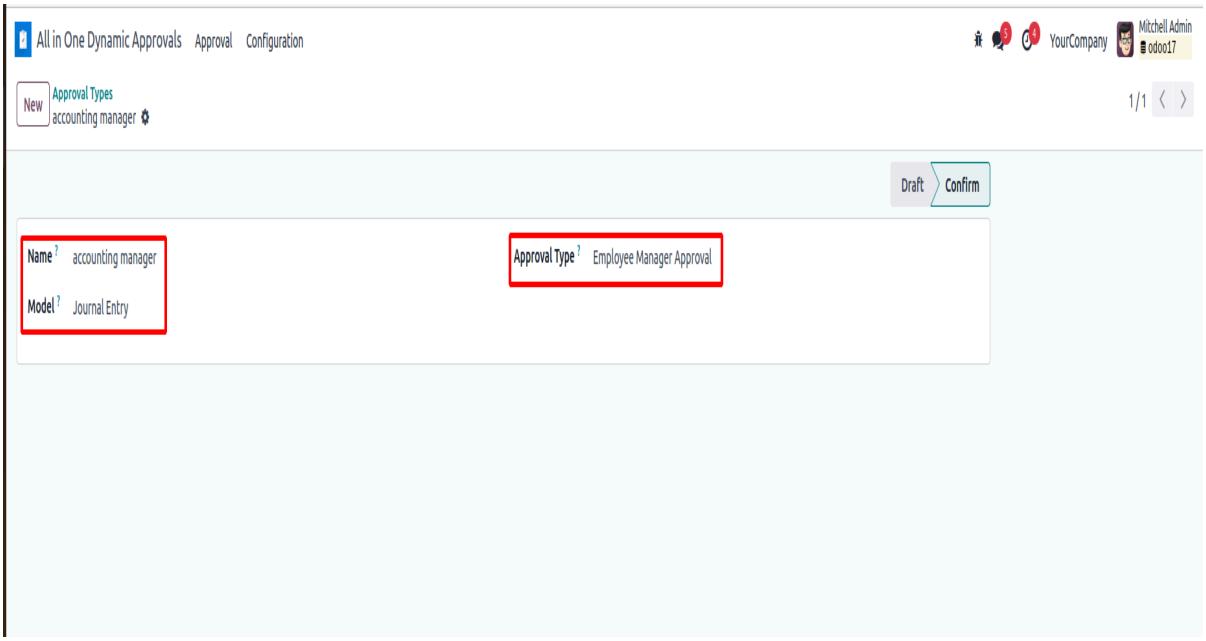

Now lets see a a record of Journal Entry and see the working of custom approval.

Since the approval type is **custom** and the field **Salesperson** value is **Mitchell Admin** we can see the approver as **Mitchell Admin** in the below image.

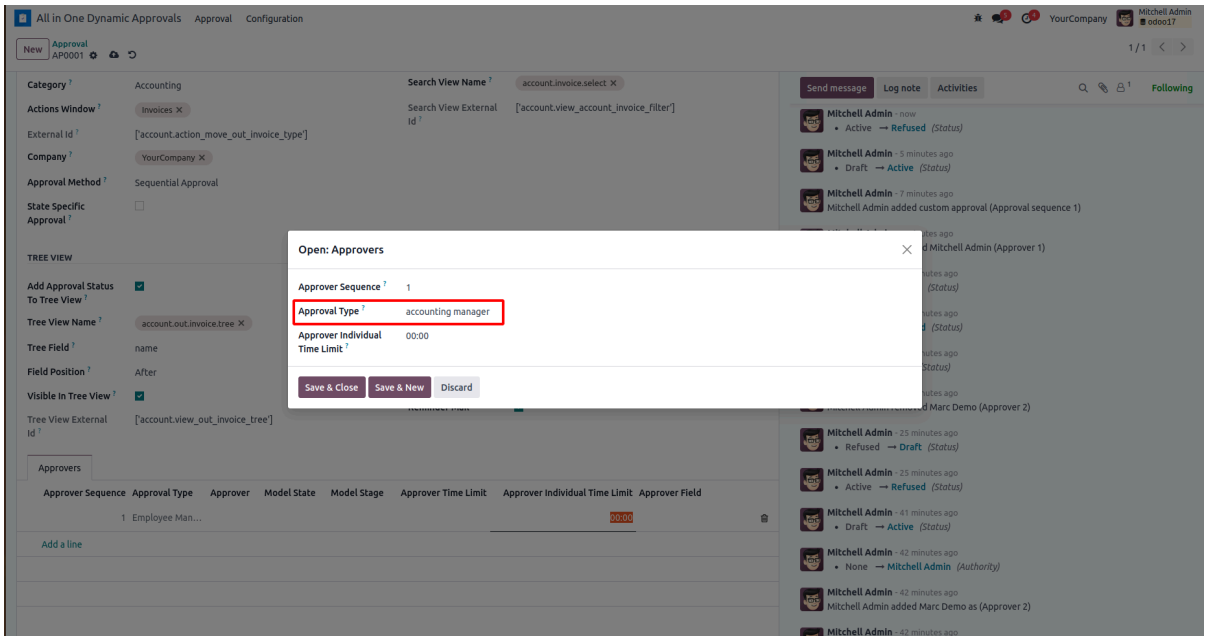

3. Manager Approval

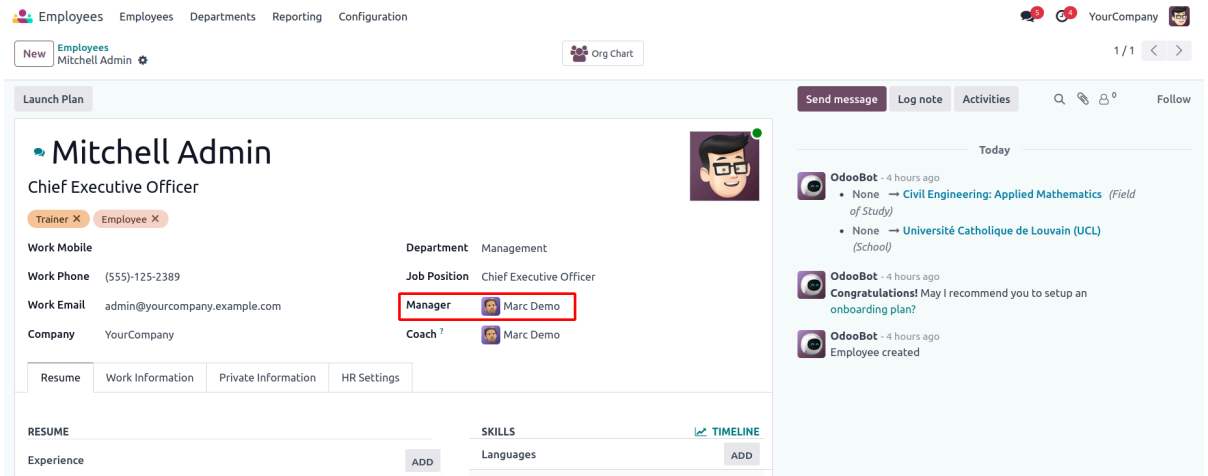

If selected option is **manger** and we confirms the approval type we can select the approval type when we are choosing the approvers in the **Approvers**

For manager approval first we need to confirm that there is a manager set, Suppose Mitchell Admin is creating a Journal Entry and manager set for Mitchell Admin is Marc Demo, Whenever Mitchell Admin craetes sale Order it should approve by Marc Demo.

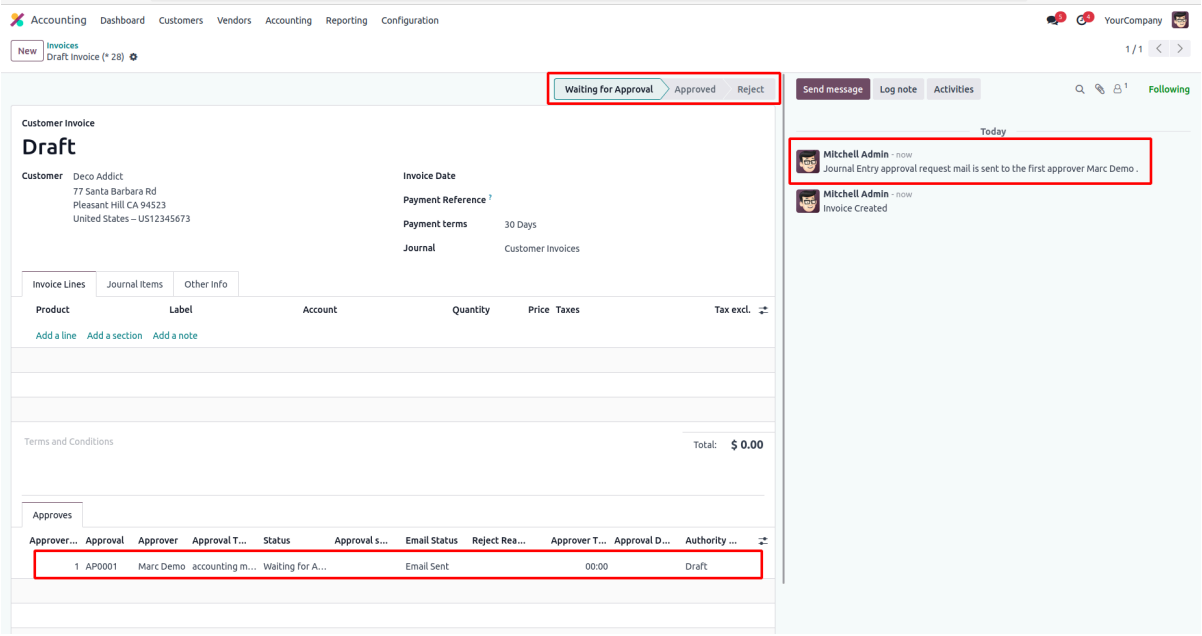

Here Marc Demo is set as manager for Mitchell Admin

In Dynamic approval choose Manager Approval for sale order

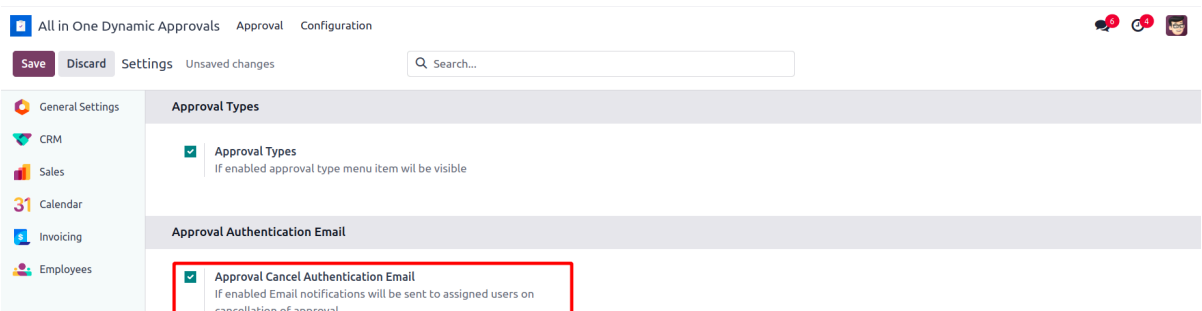

Now let's see a newly created Jounal by Mitchell Admin

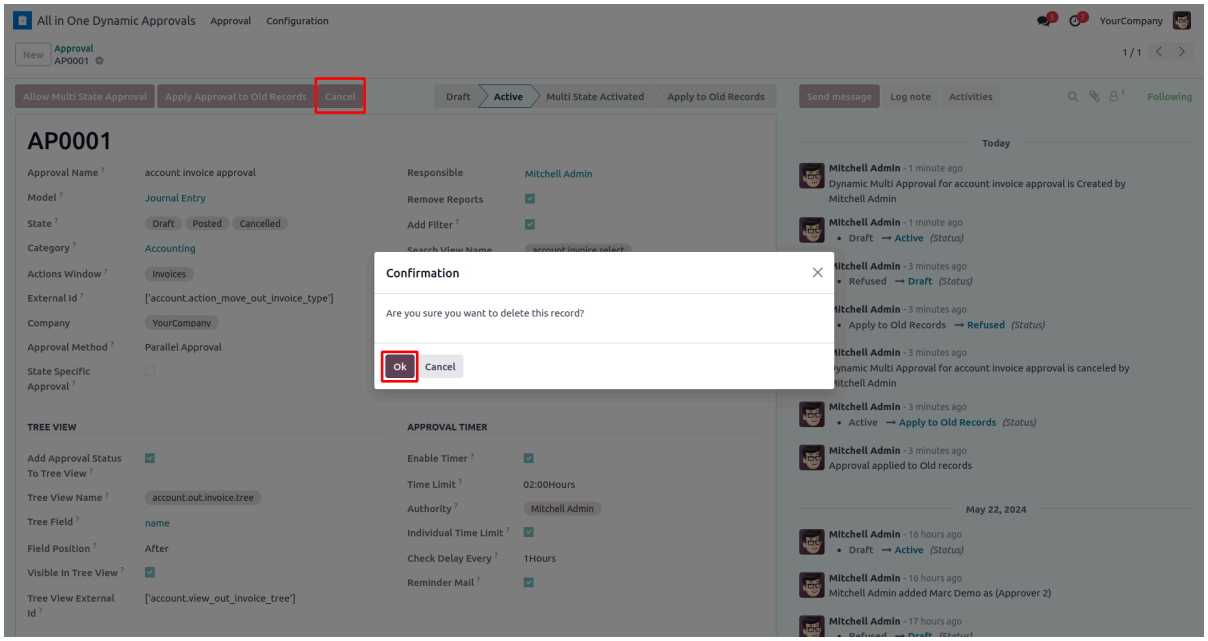

Approval Authentication Email

1. Approval Cancel Authentication Email

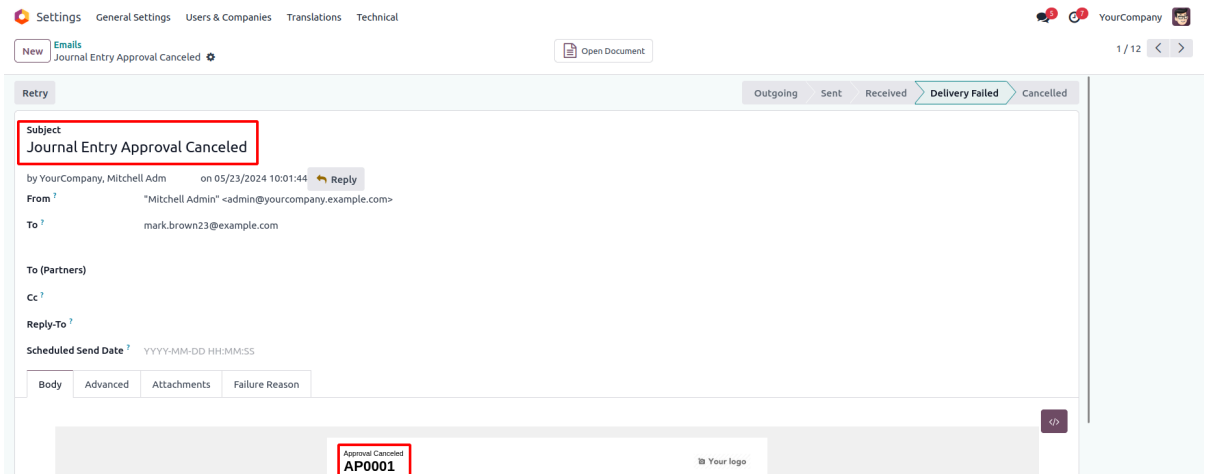

Enable to add users to send email notification with information on cancelling the approval set to a model.

Go to Dynamic Approval open a record and click cancel button and click on ok.

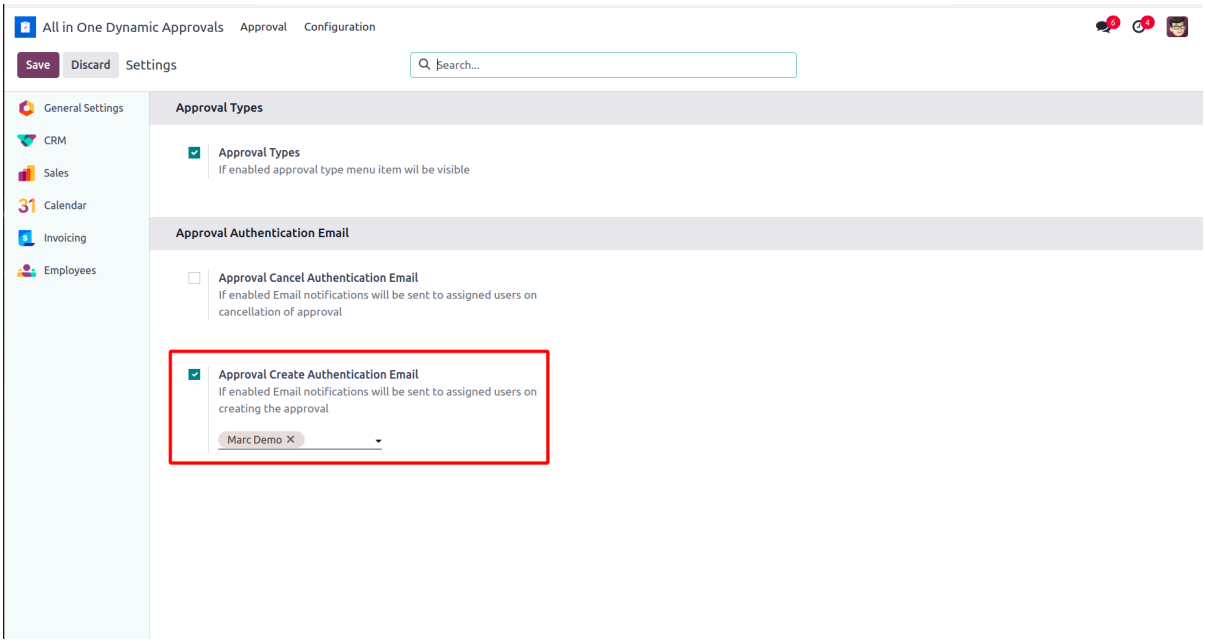

On clicking the cancel button in the Dynamic Approval model email will be sent to the mentioned usres.

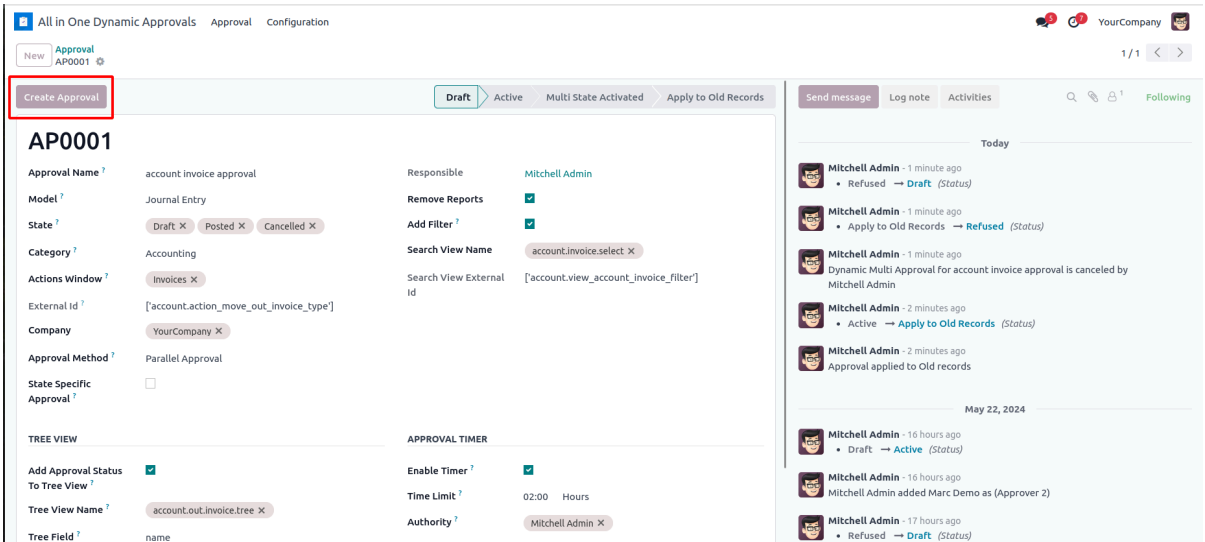

2. Approval Create Authentication Email

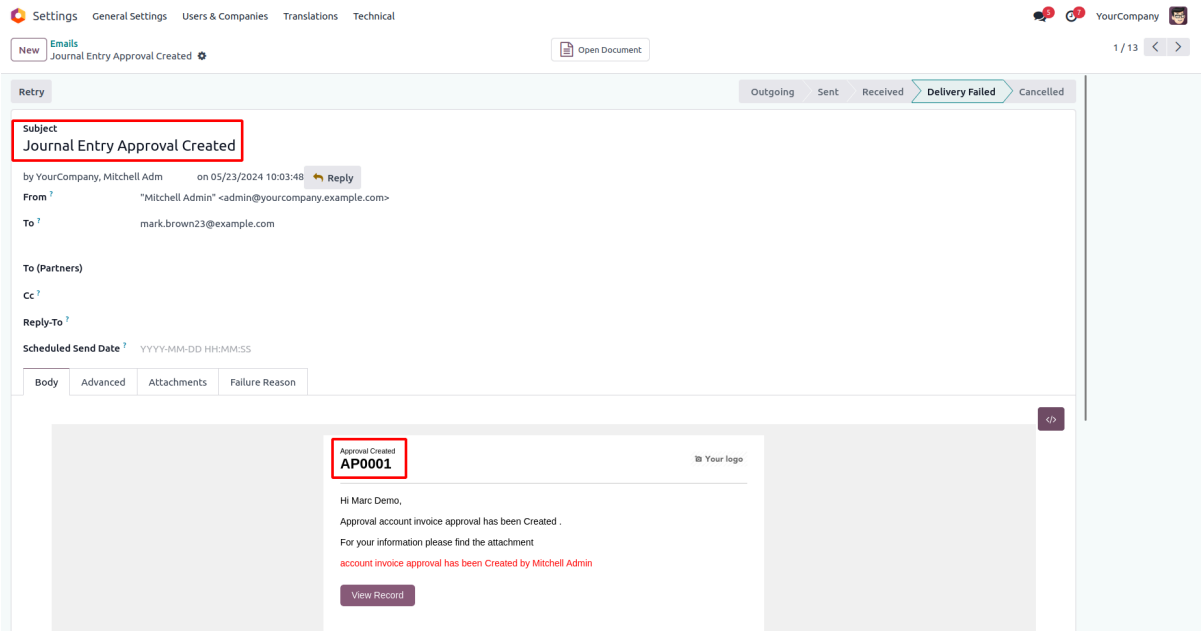

Enable to add users to send email notification on creating a new Dynamic Approval to selected users. For example here i have enabled the the Approval Create Authentication Email and selected user as Marc Demo, let's see how it's works.

First let's create a Dynamic Approval for Sale Order and Click on the button "Create Approval", and check the mails.

After Checking the mails in the sertings we can see a mail has been created there upon cretaing the Dynamic Approval.

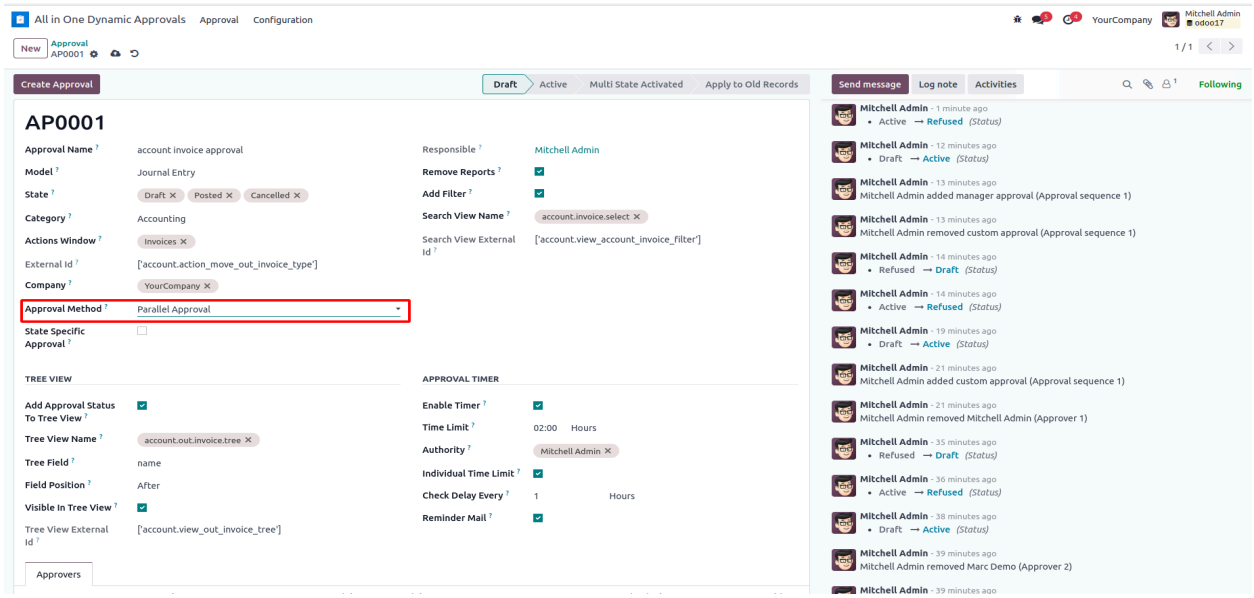

Approvers

Here we need to add the approvers.The field will support multi approvers. It has two types of approval. Approver adding time you can set the type. Also you have a deleting option for the approver . Approver deleting does not effect after approval creation.

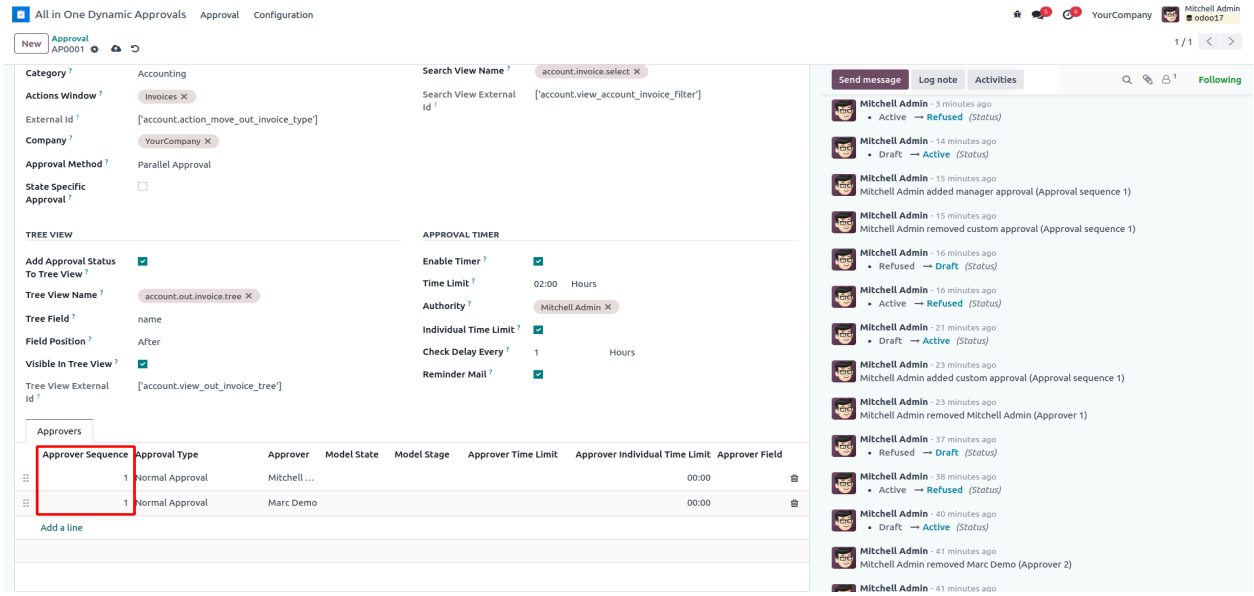

1. Parallel Approval

It means added all approvers can Approve/Reject the record and at time all approvers receive the approval request

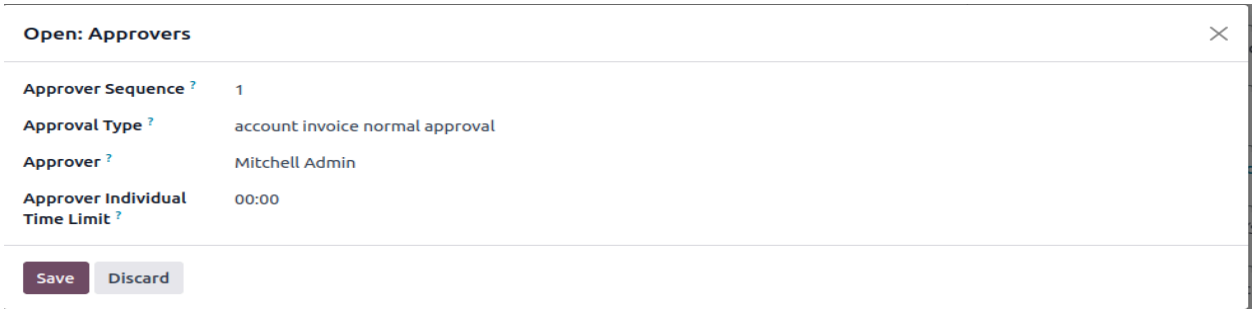

mails.For parallel approval, the approver adding time sets the sequence 1 for all approvers.

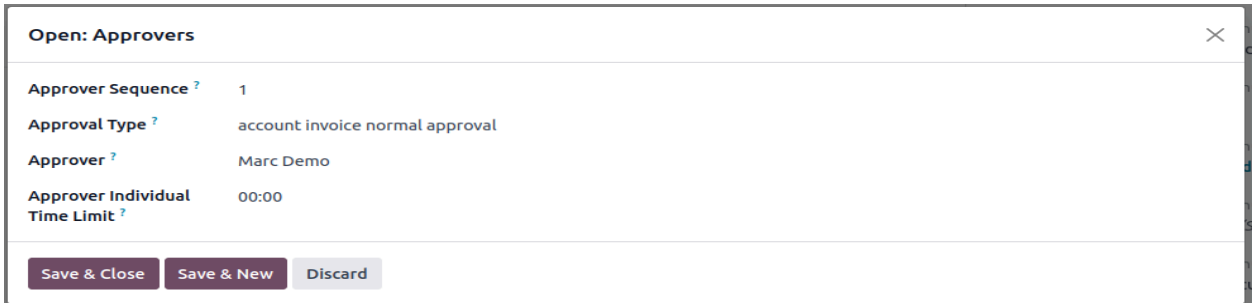

.

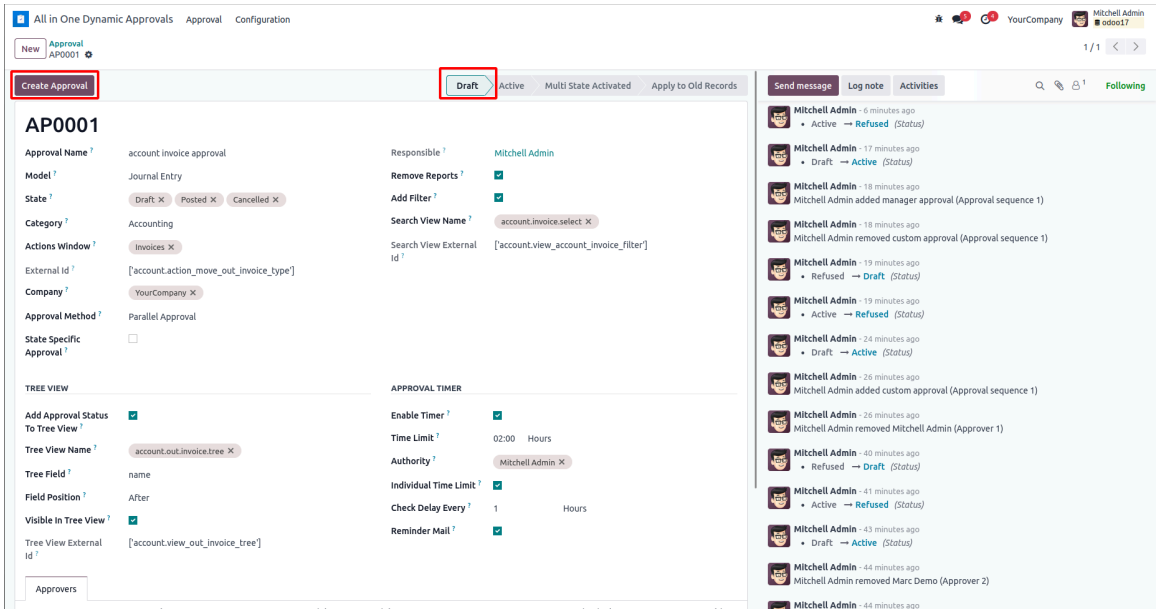

For the confirmation after the saving you can click on the approver name. That time opened a new form. That form you can see the Approver Sequence is 1 for all the approvers added in the list.

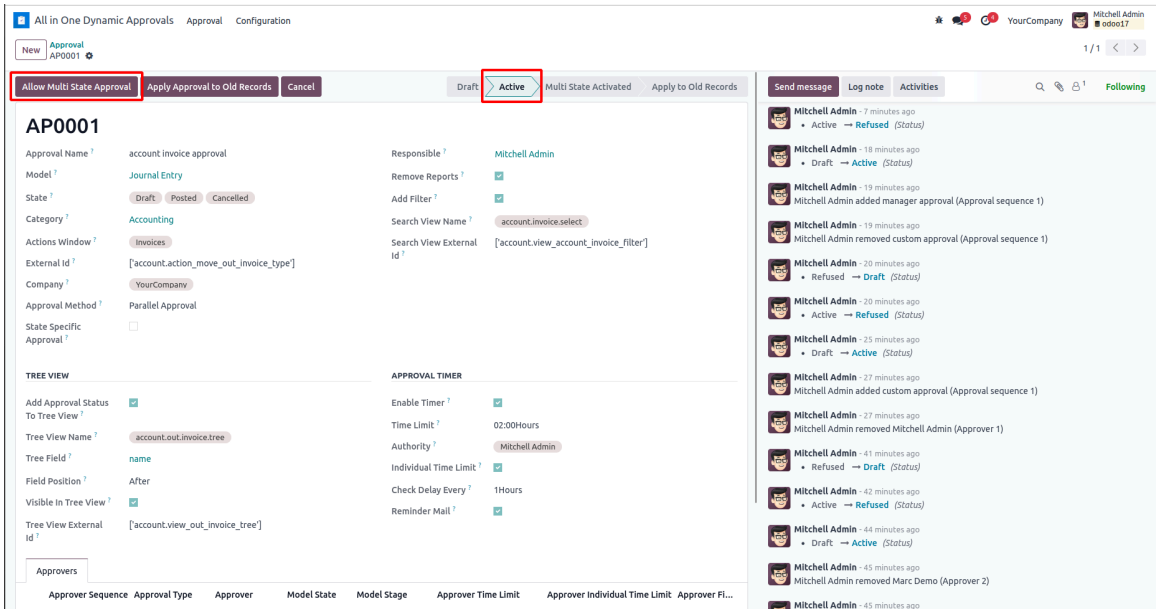

After all the fields are filled you can click the **Create Approval** Button.

The approval will be created successfully and the state will change to the **Active**. If you added multiple states in the field, It only works the module first state. Otherwise you can skip the next step.

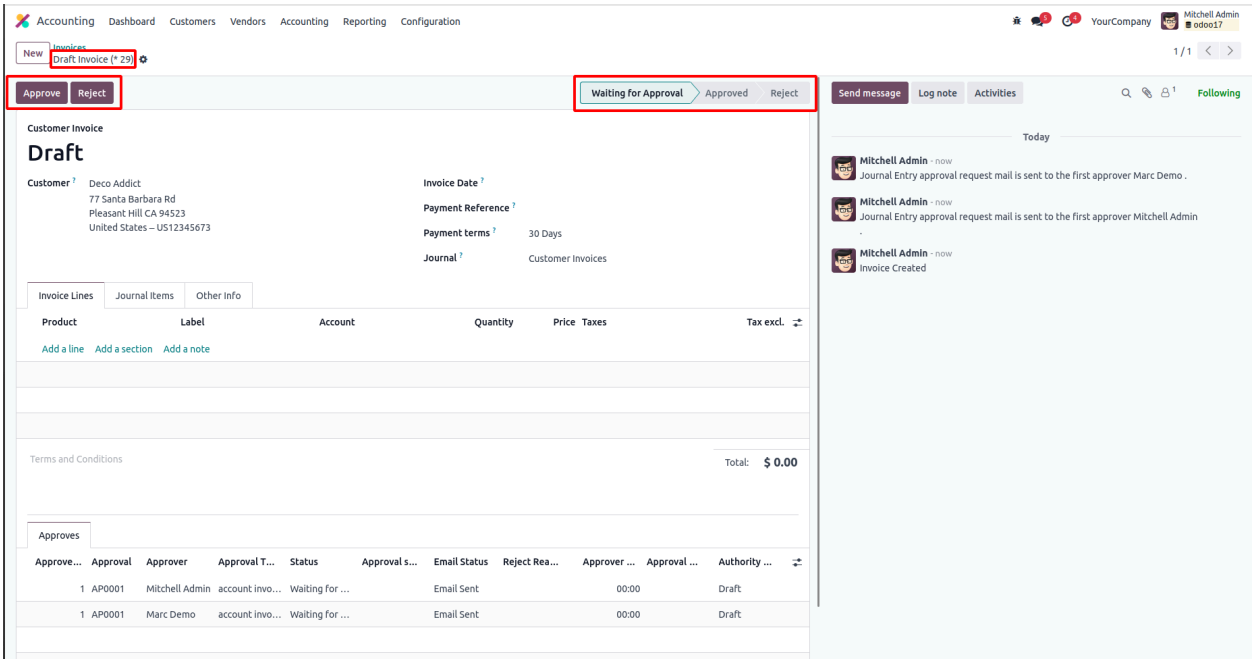

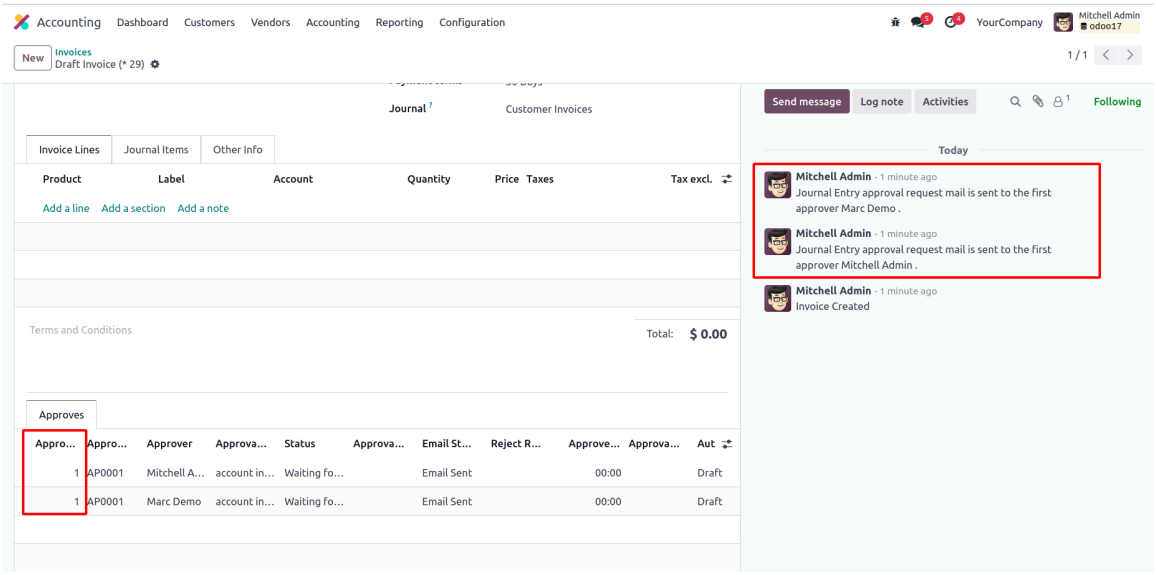

Then you will get a new button **Allow Multi State Approval**. The button click will activate the multi state approval and the approval will ask every state in all records in the module. Also the approval record state will change to the Multi State Activated.

Next we can create a new record in the approval created module and check the approval working.

First we can check the working of the **Parallel Approval**.

Here I'm creating an Invoice with a normal user.

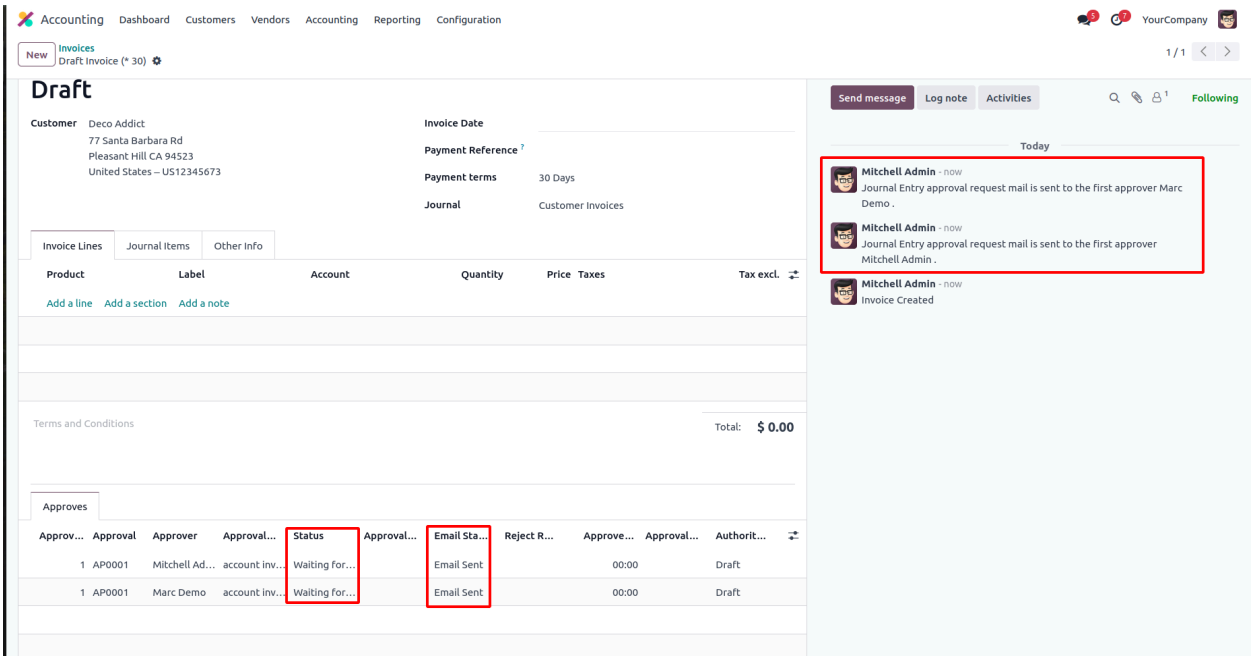

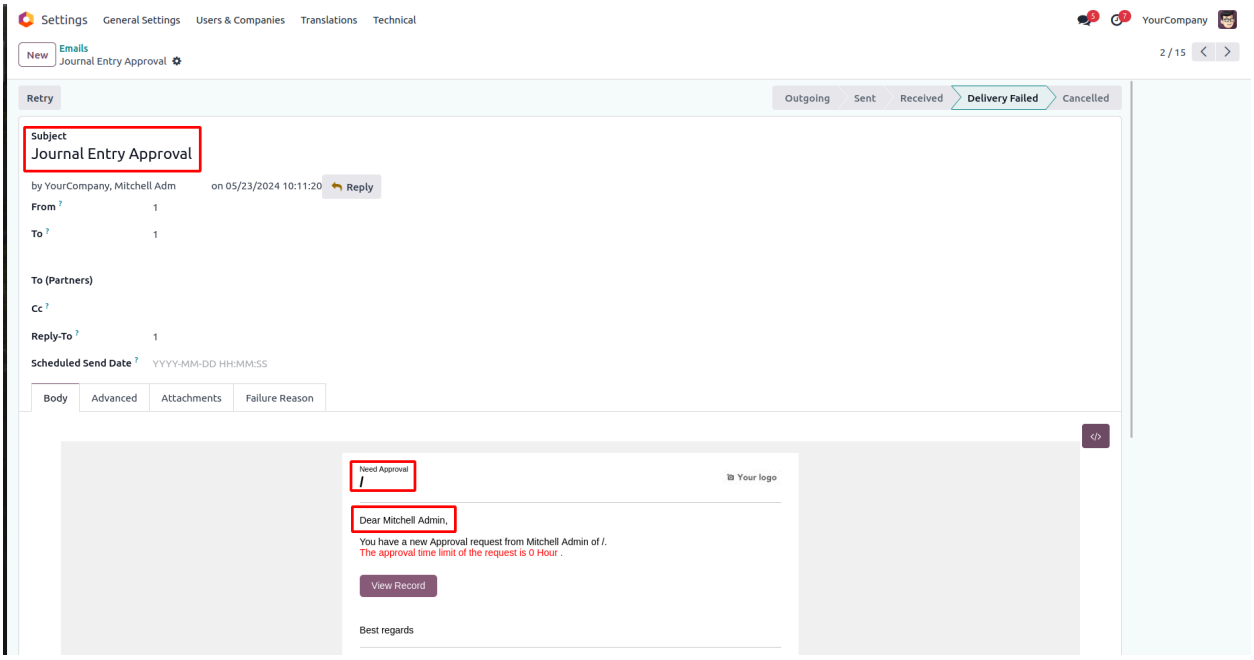

Here approval requests will send all approvers and at the time all approvers can approve the request. After they all approve the request then move to the next step.The approval history will keep in the chatter.

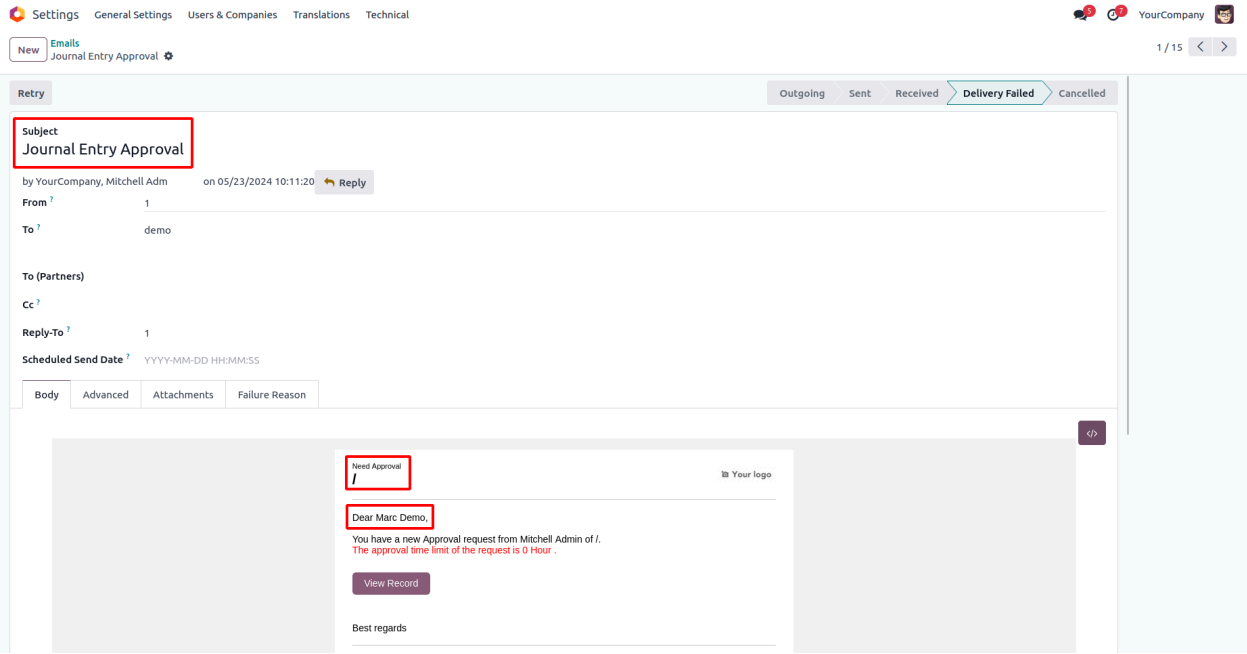

The record creation time also sends the mail with all approvers. The Approver outside of the office approver can click the View Record button and validate the record and Approve or Reject the request.

Note: If you do not see the mail in the Inbox, check the spam. The mail in spam clicks the Not Spam button in the mail. After the mail will be received in the Inbox.

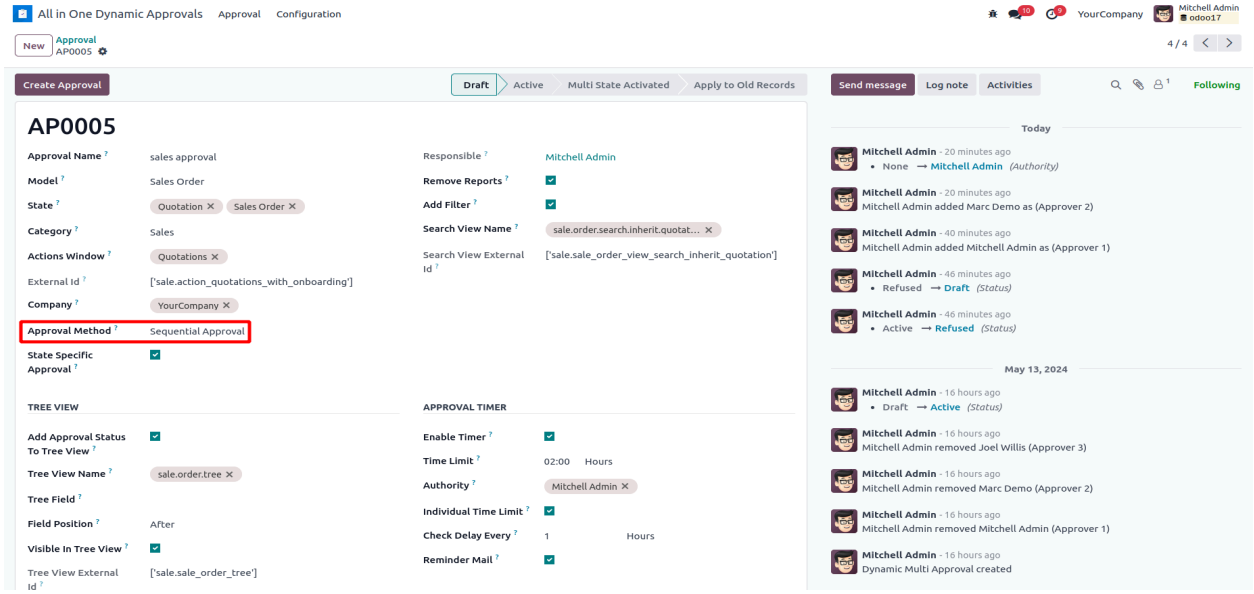

On the view record click it will redirect to the approval request record. In the mail also mentioned the approver time limit.

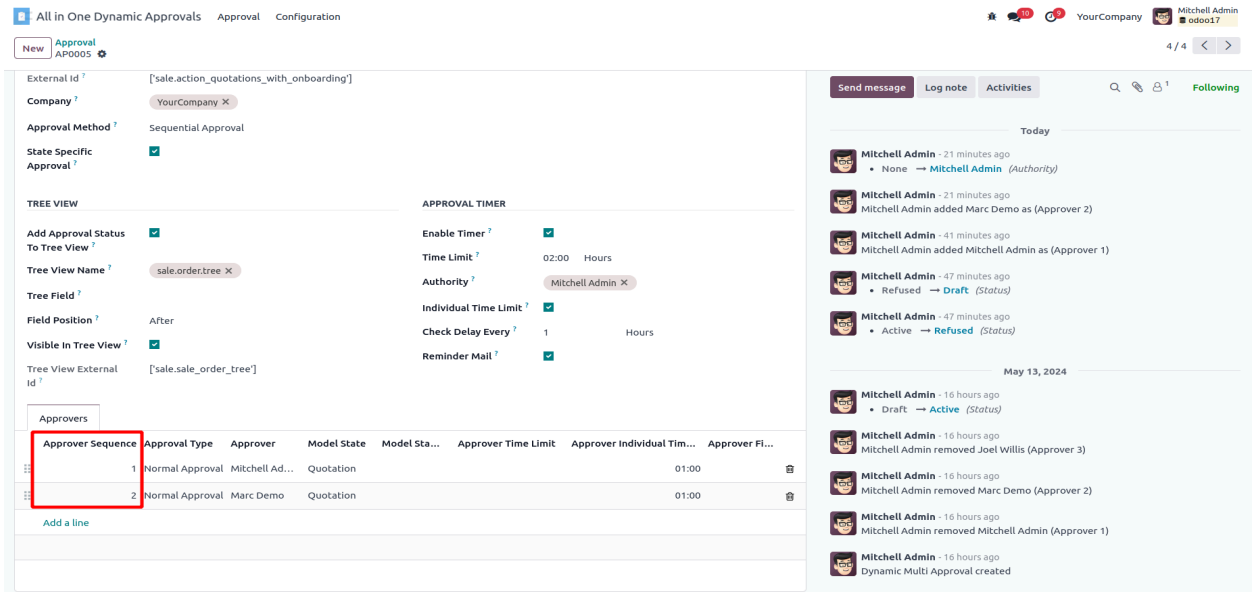

2.Sequence Approval

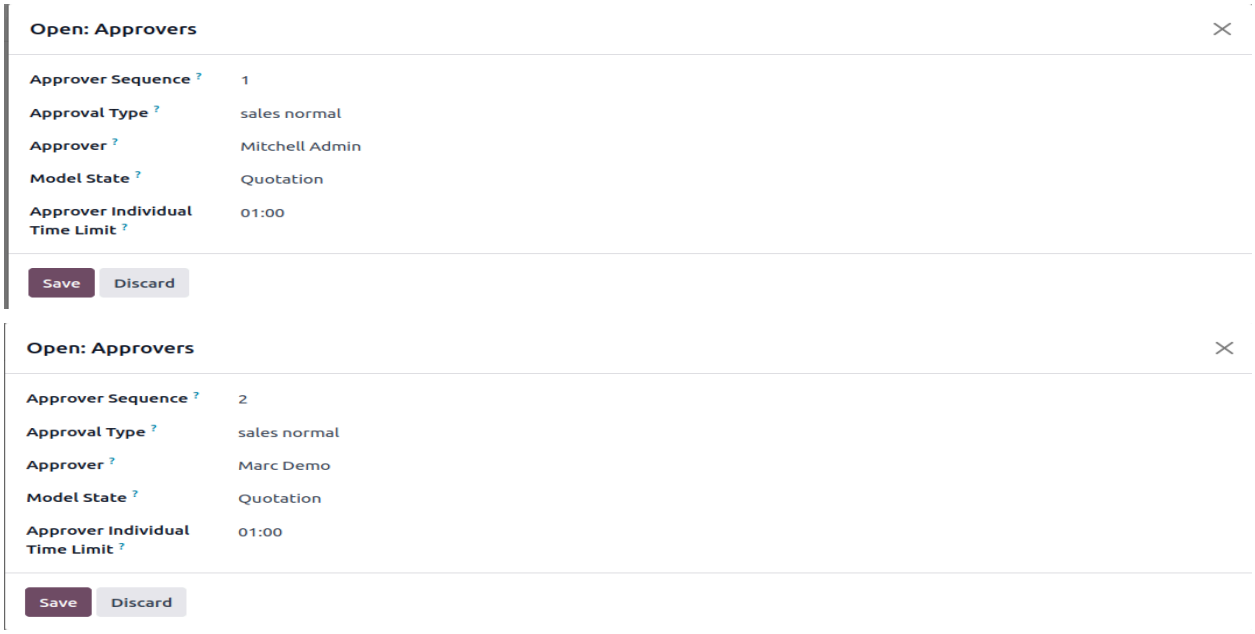

In this option in the order line first person only receives the approval request. After the first person approves the record then moves to the next approver.

For the Sequence approval, the approver adding time sets the sequence number for approvers.

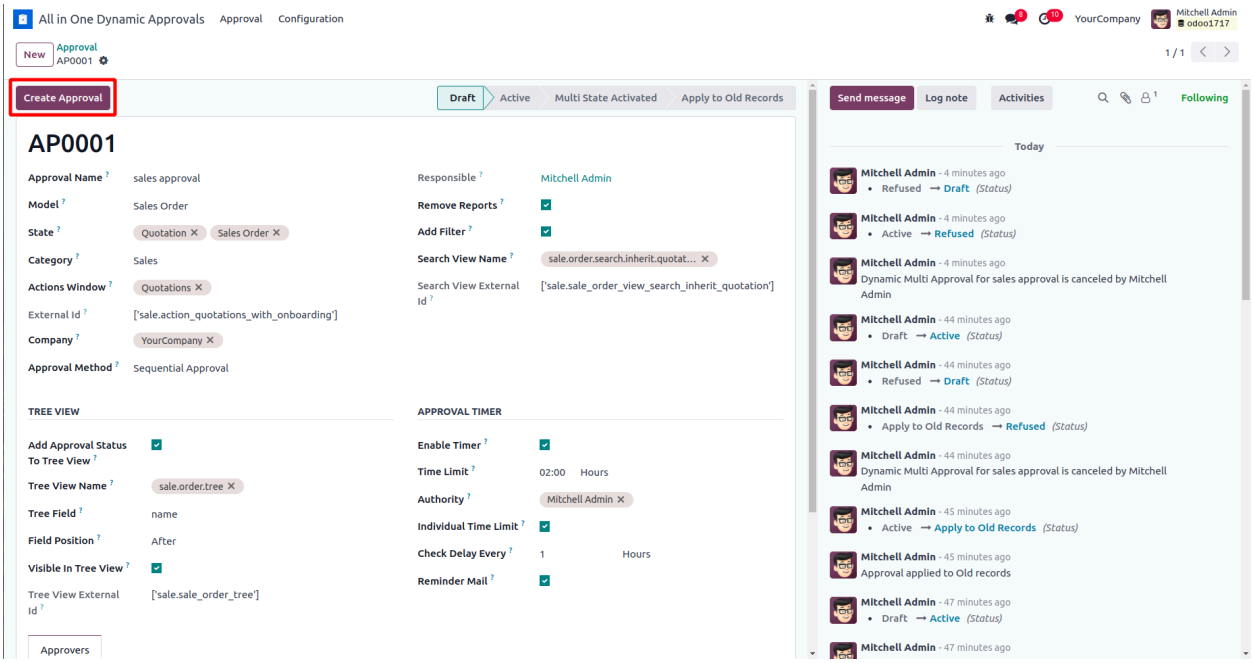

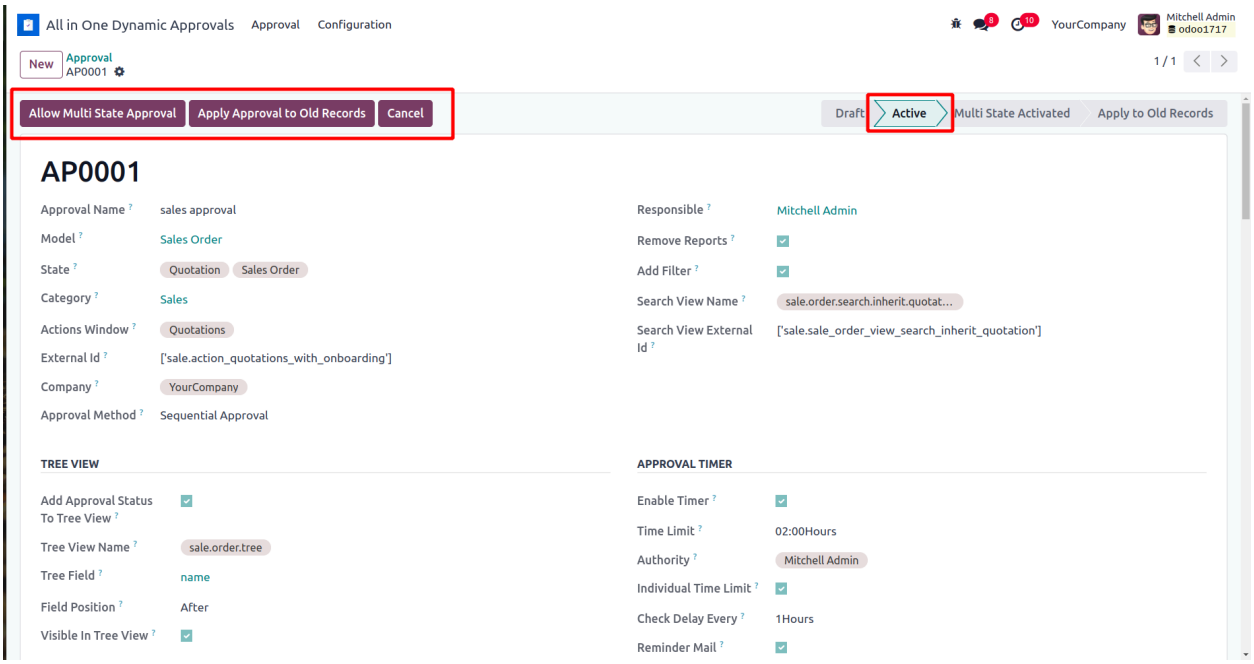

For the confirmation after the saving you can click on the approver name. That time opened a new form. That form you can see the Approver Sequence is 1 for the first approver and the next approver sequence is another one.

After all the fields are filled you can click the **Create Approval** Button.

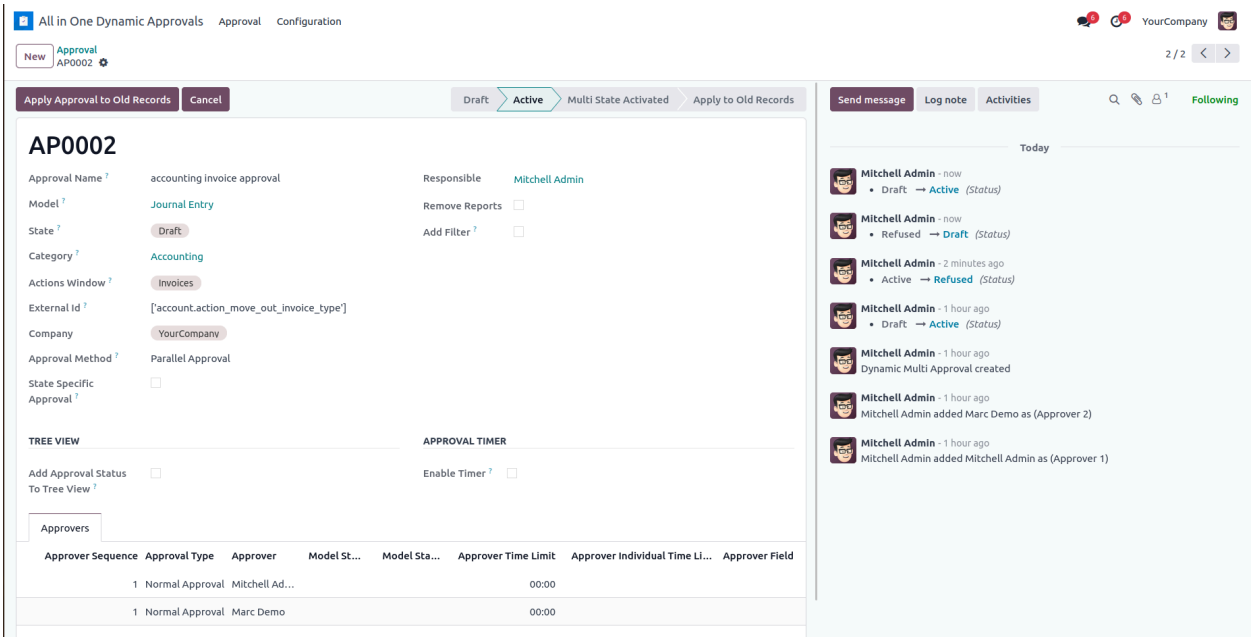

The approval will be created successfully and the state will change to the **Active**. If you added multiple states in the field, It only works the module first state. Otherwise you can skip the next step.

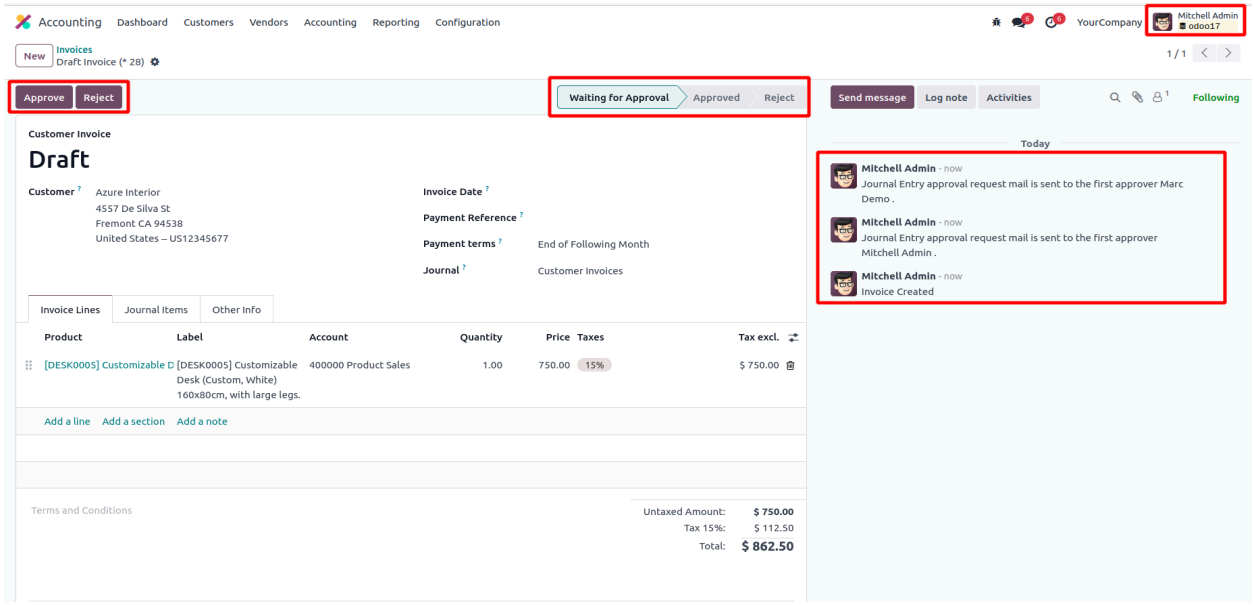

Then you will get a new button **Allow Multi State Approval**. The button click will activate the multi state approval and the approval will ask every state in all records in the module. Also the approval record state will change to the Multi State Activated.

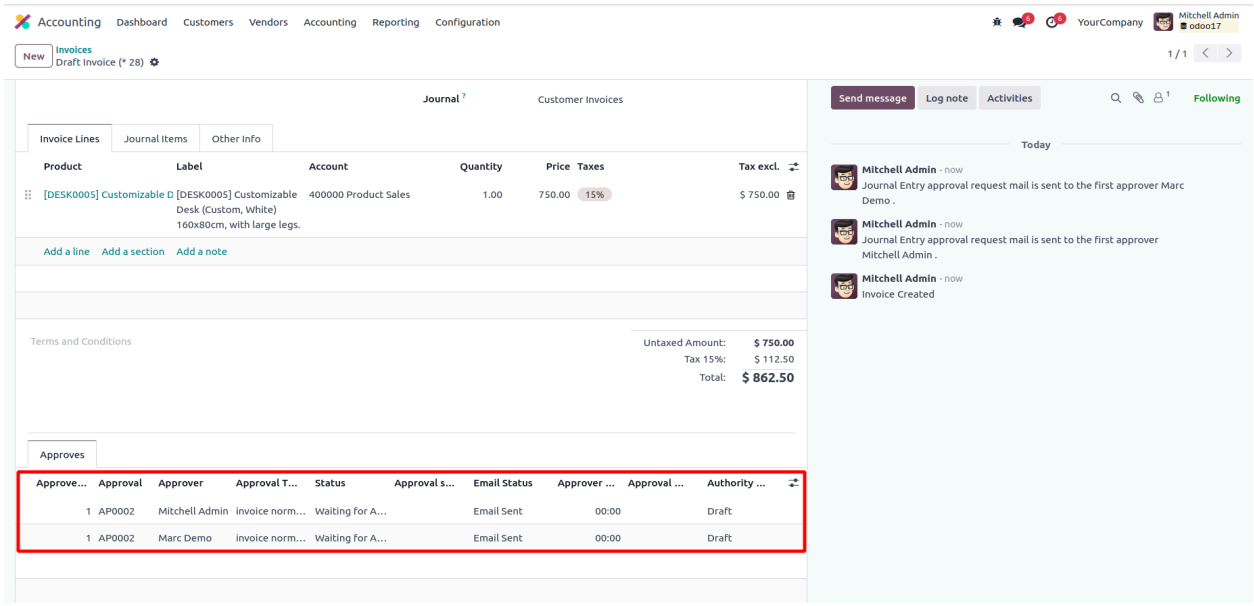

Next we can create a new record in the approval created module and check the approval working.

First we can check the working of the **Parallel Approval,** for that we can create an approval for Journal Entry account.move model for invoicing , the action id for the invoicing is "**Invoices"** of id "**account.action_move_out_invoice_type".**

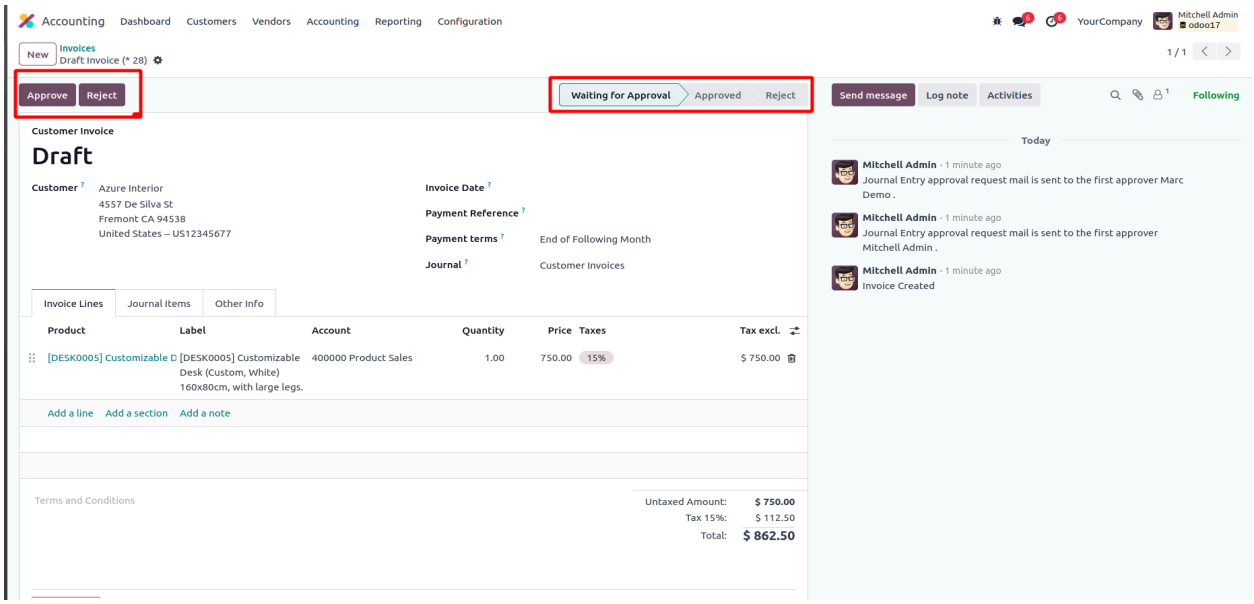

Here I'm creating an Invoice with a normal user.

Here approval requests will send all approvers and at the time all approvers can approve the request. After they all approve the request then move to the next step.The approval history will keep in the chatter.

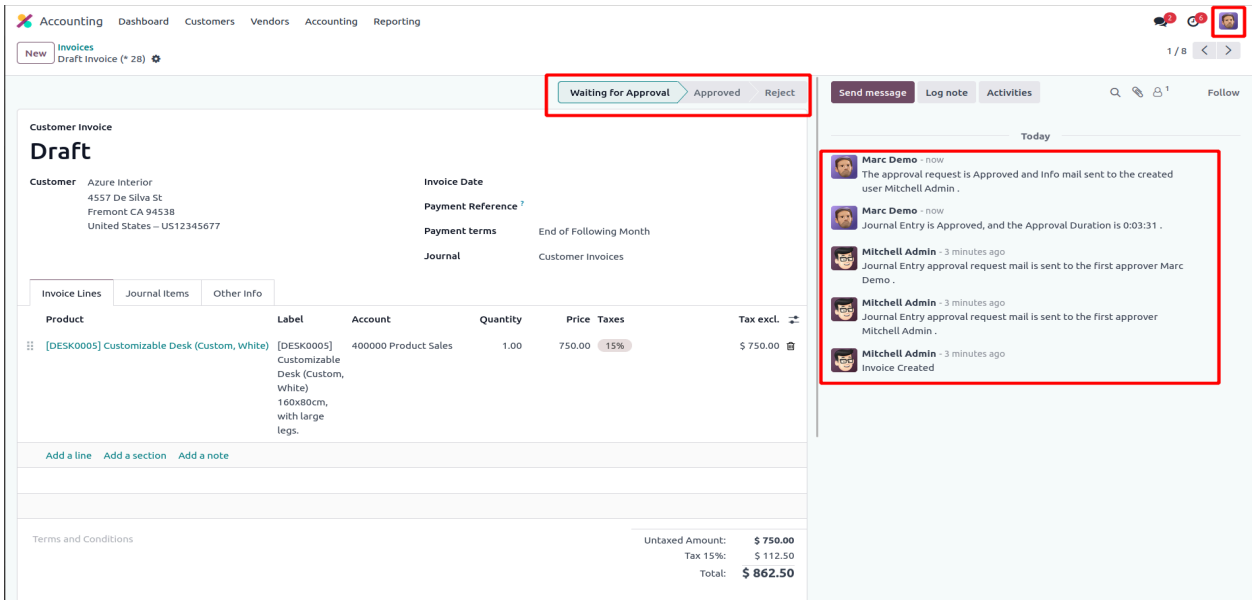

Next we can check the approver side view.

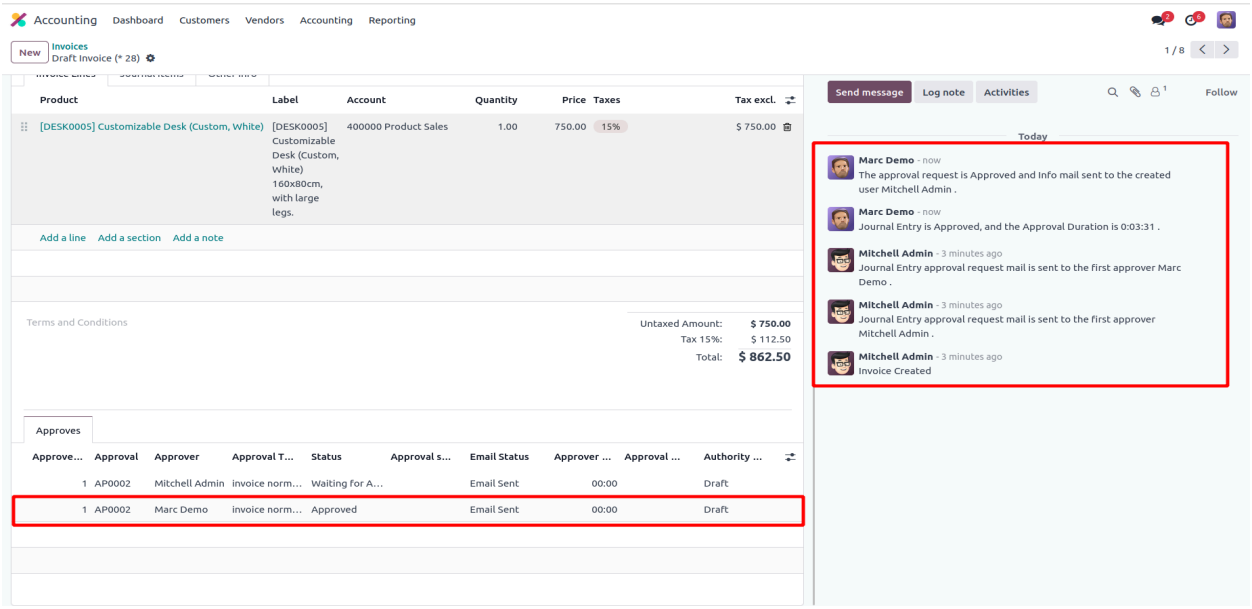

The listed all approvers can see the approval option at a time.Next we can check the approve effect. This is ***parallel*** approval, that reason I am doing the approval example with 2 approvers.

Let's check the after approve button click effect.

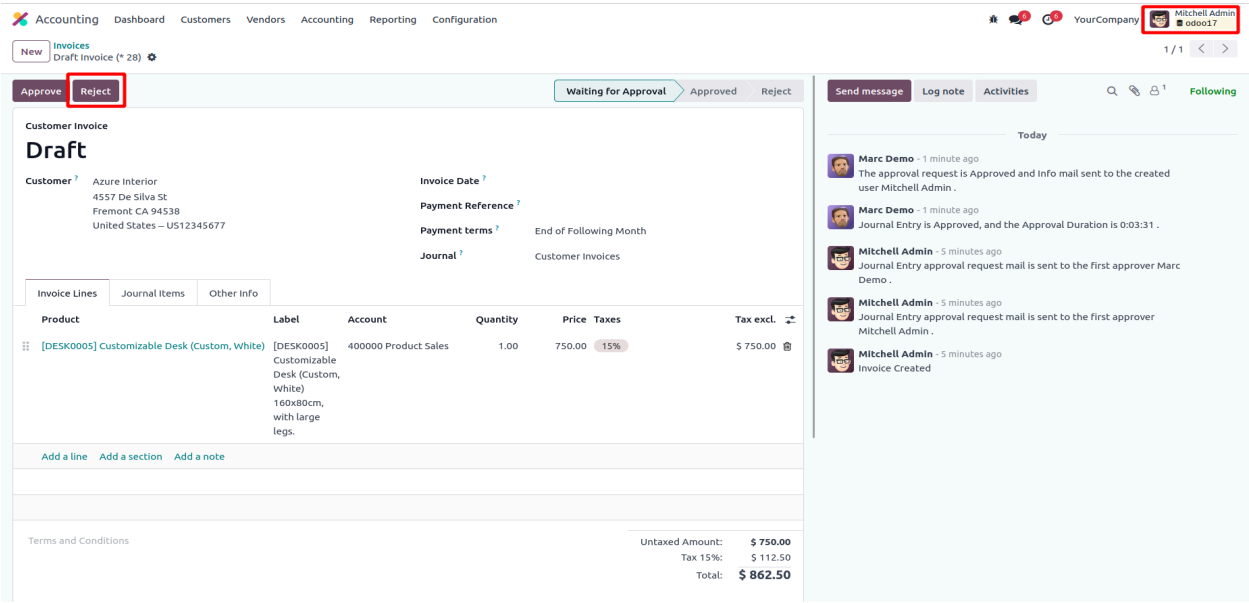

The above screenshots you can see after the approve and reject buttons are removed. Then corresponding approver status is changed Waiting For Approval to Approved and also recorde the approval taken duration to the Approval duration field.Then you can see the approval updates are recorded in chatter.

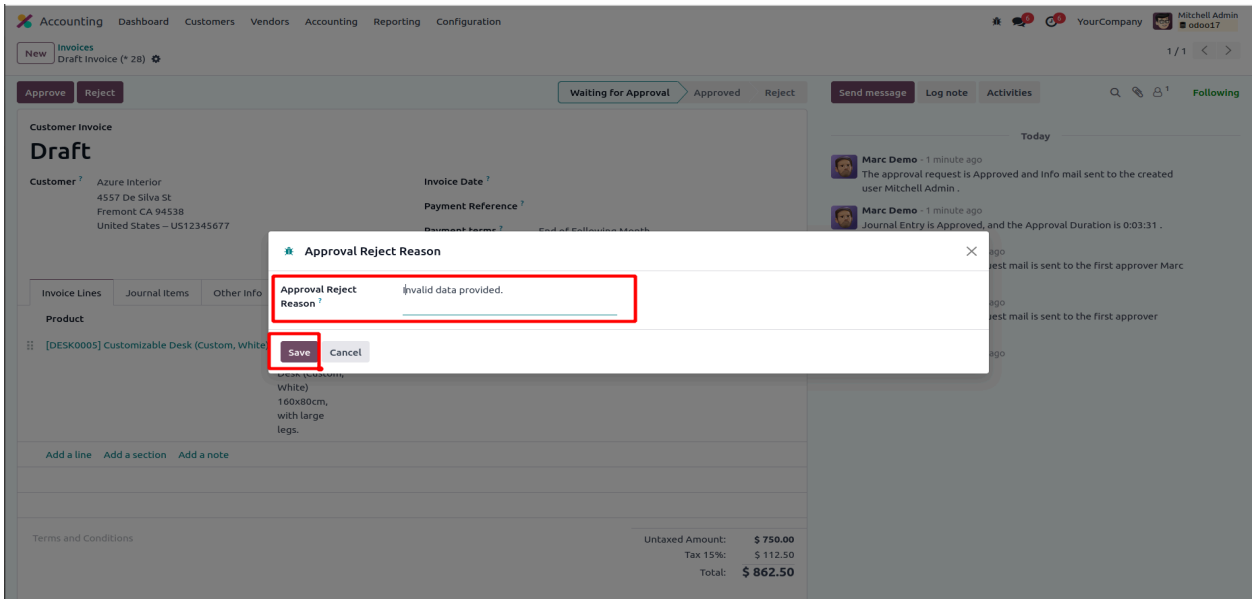

In the list of approvers all are approved. Then it will get back to the normal process and the approvers details will keep the order for the company's further purpose.

In the list of approvers one approver will **Reject** the request, Approver gets wizard and approver can enter reject reason.

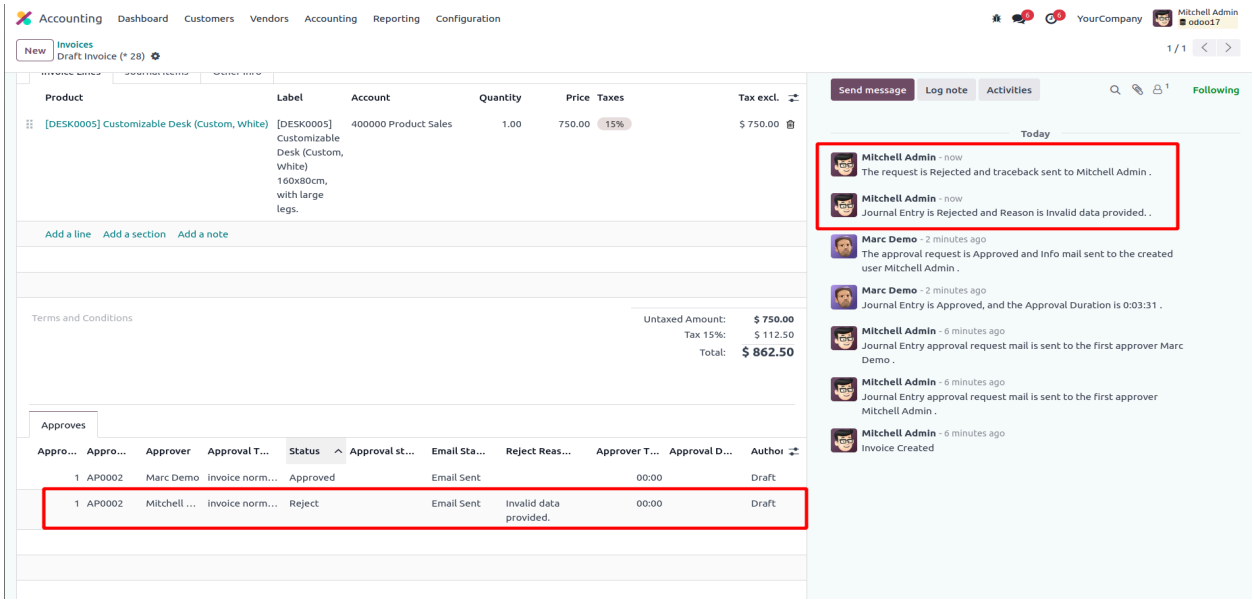

Added below before rejecting the screenshot.

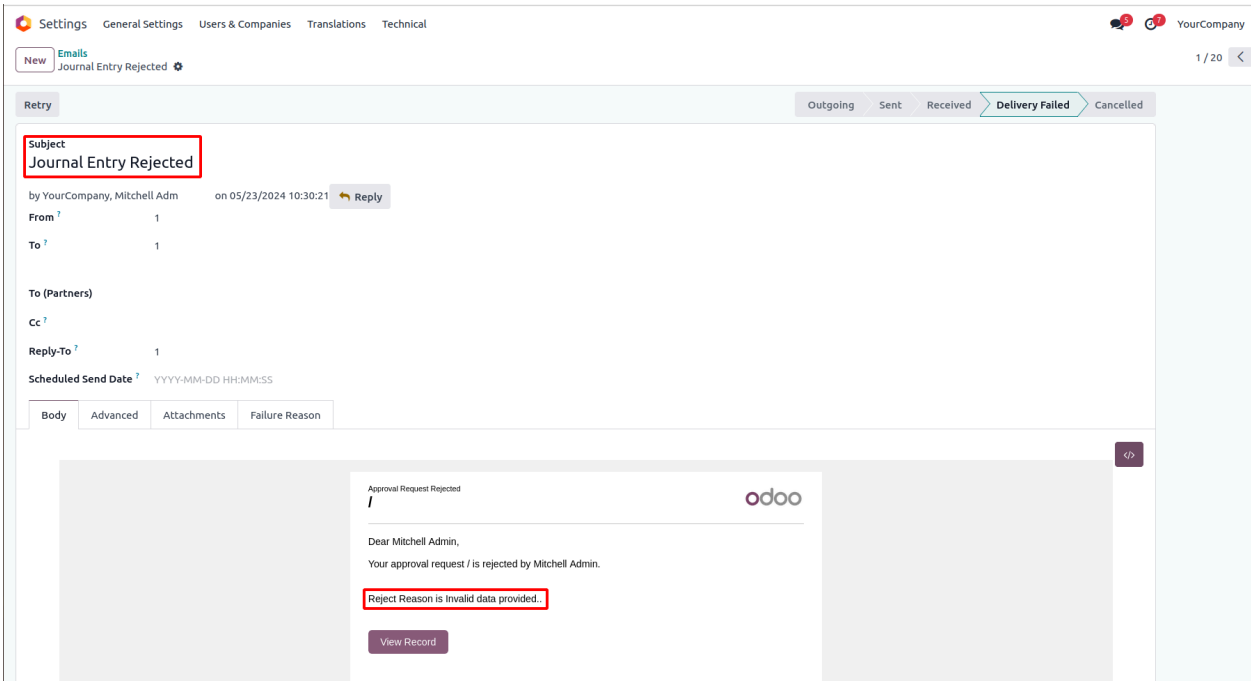

After the Reject button click .

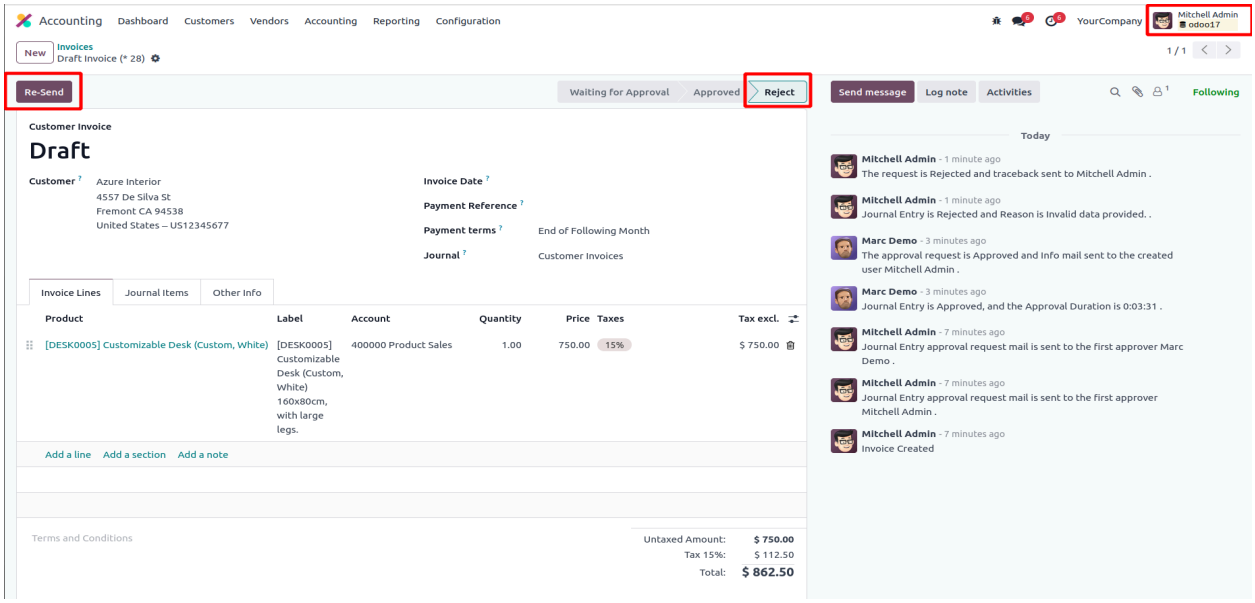

The reject reason is stored on the corresponding approver orderline.

Failure Reason
Approval Request Rejected
/
odoo
Dear Mitchell Admin,
Your approval request / is rejected by Mitchell Admin.
Reject Reason is Invalid data provided..
View Record

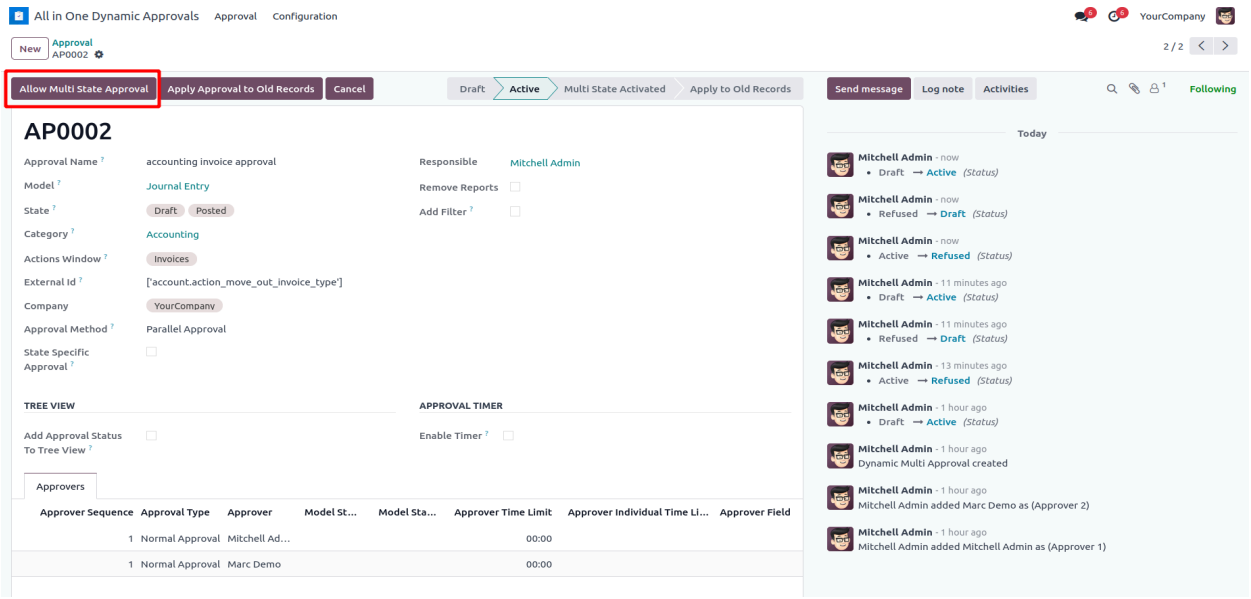

After the request rejection Approvers and Requester get a new button **Resend**. Then requests created by the user can solve the issue of rejection Or the Approver by mistake clicking the Reject button. Click the **Resend** Button, It will resubmit for approval for all approvers.

The request already approved appvers status also reset to the Waiting For Approval. The approvers can again see the Approve and Reject Button. Then approvers can recheck the record and do the needful action.

The approval process will continue until all approvers approve. After that display the normal header and continue the further process.

The multi state added in the approval form, the record that state reaching time also asks for approval and continues the same process.Below adding the after the approval record screen shot.

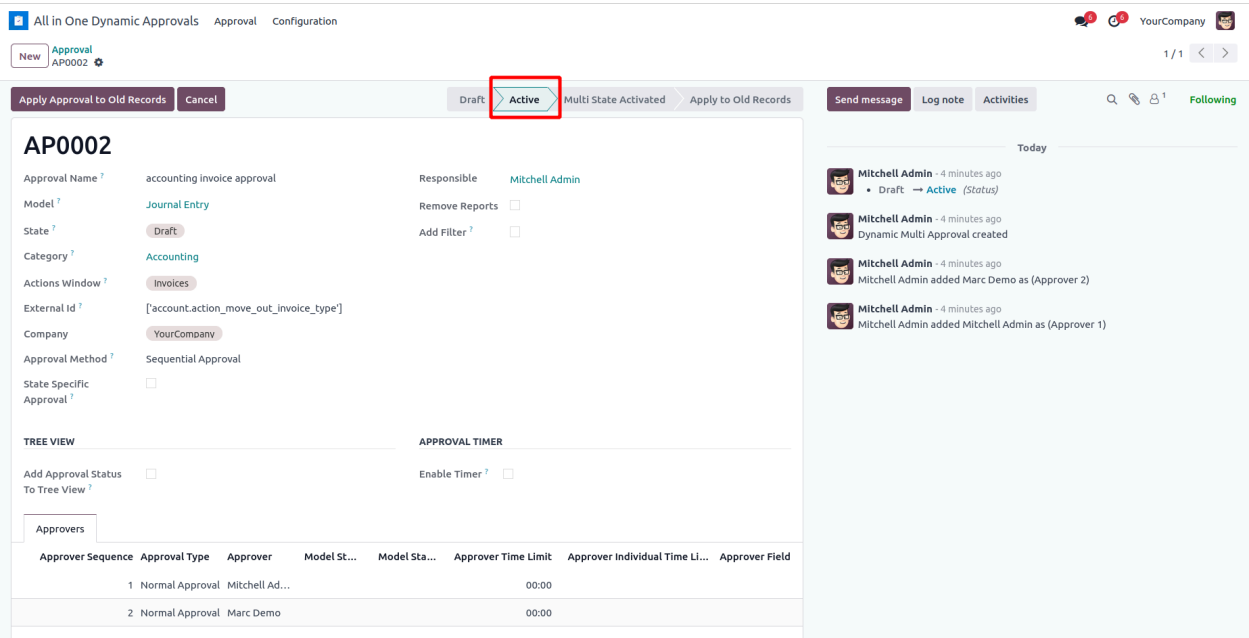

Next we can check the **Sequence wise approval**.Above I mentioned that in accounting the Customer Invoice, Credit Note, Vendor

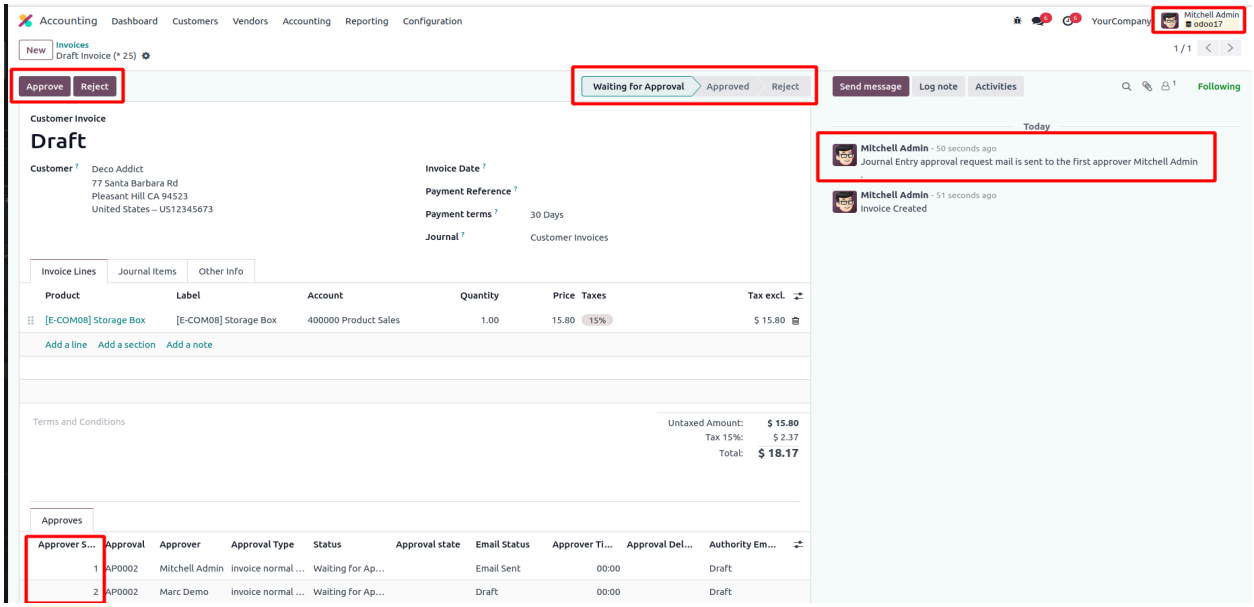

Bill, Refund, Journal Entry ... are the same model. In this type case we need to select the all form corresponding action in the Action Window field.

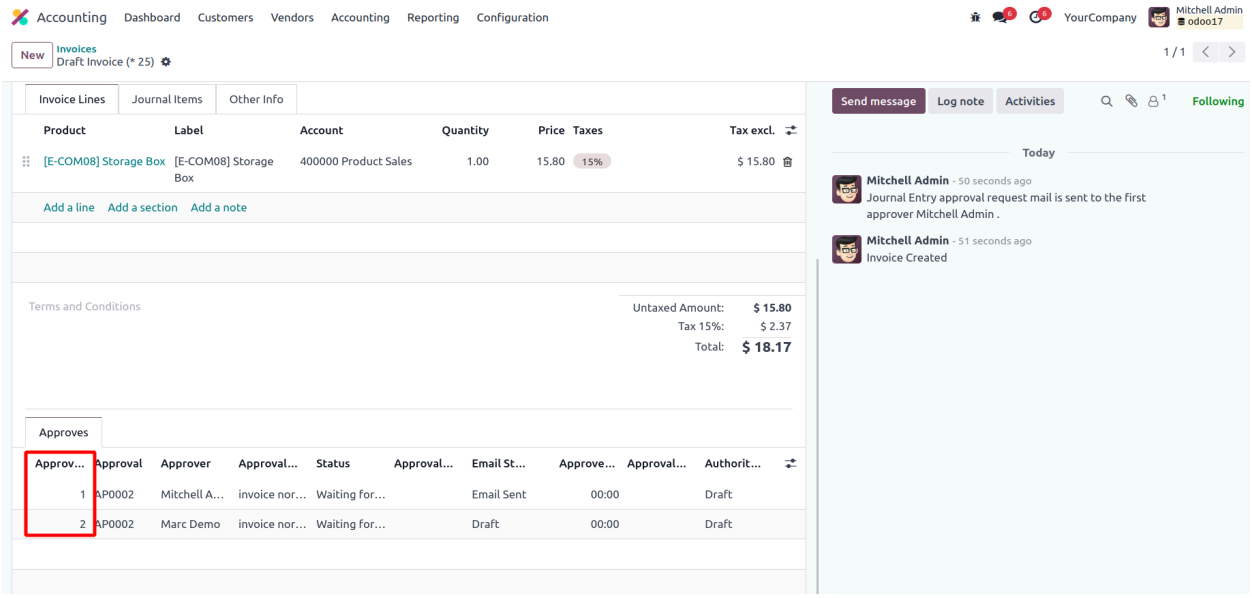

In my point of view Accounting is only using the same form in multi actions. Other modules are using single action. If you are going to create approval for Accounting follow the correct step above explained. Otherwise you will face a header visibility issue in accounting.

Here i have created an approval record for invoice action of accounting

Now let's check the Sequence wise approval. Previous Example created approval canceled and recreated same with sequence wise method. Let’s create a record in the accounting invoice

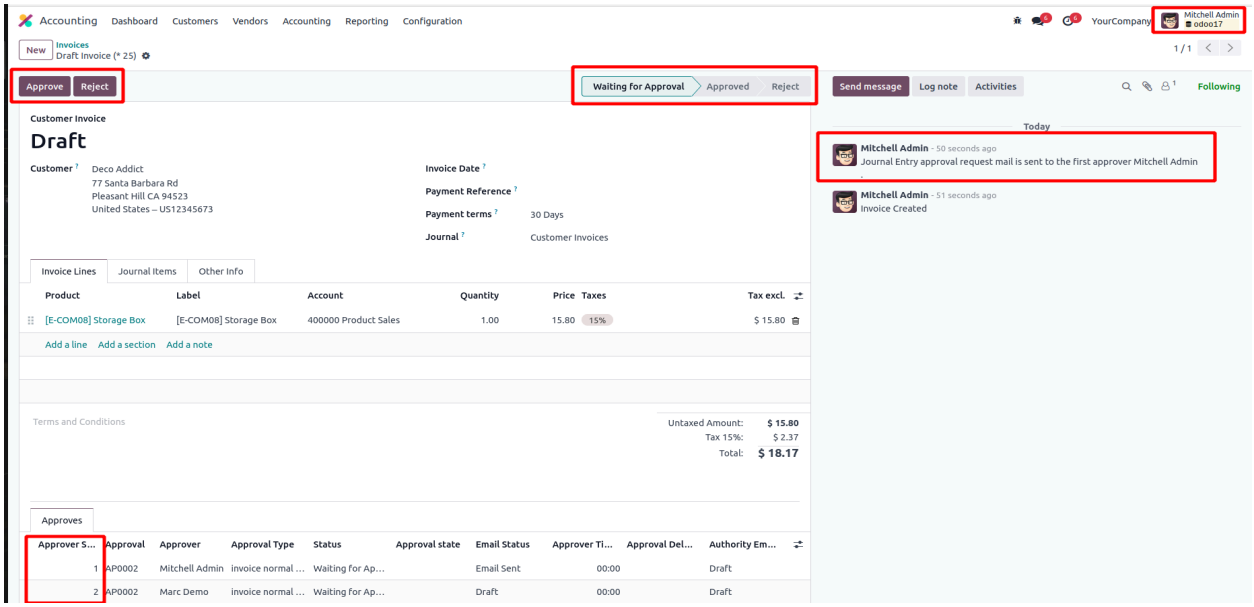

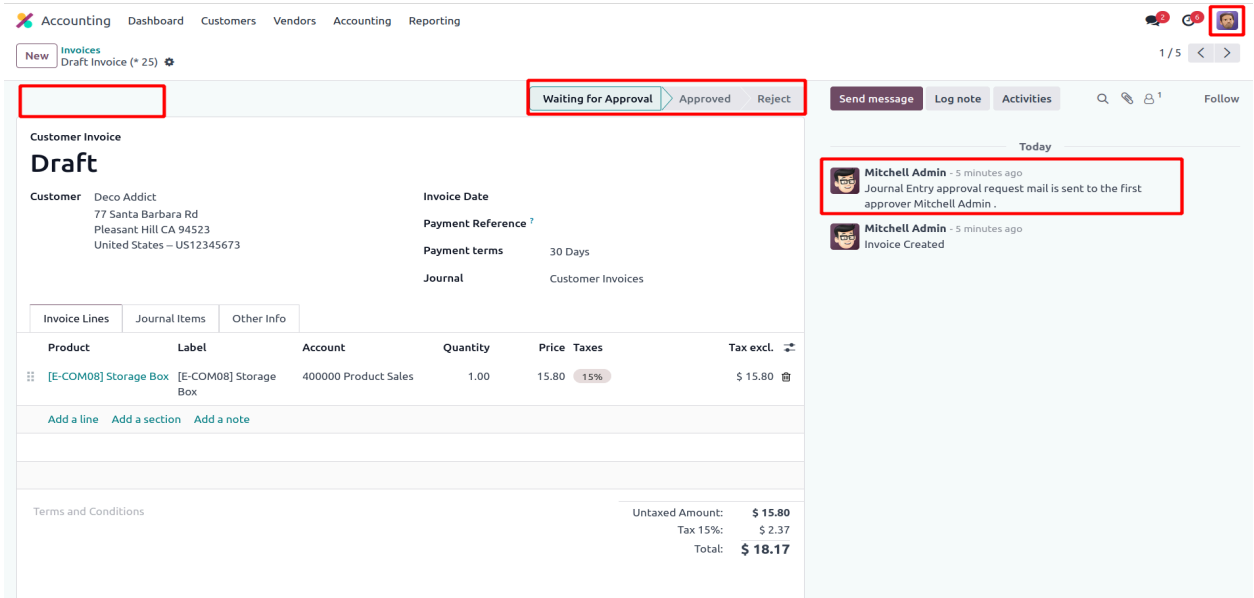

In the above screenshot you can see the difference between the parallel and sequence approval. Here the approval sequence is 1,2. The second approver only visible approval buttons after the first approver approval .Other works are the same on the parallel case.

Let's check the first and second approvers view. It will help you to understand better.

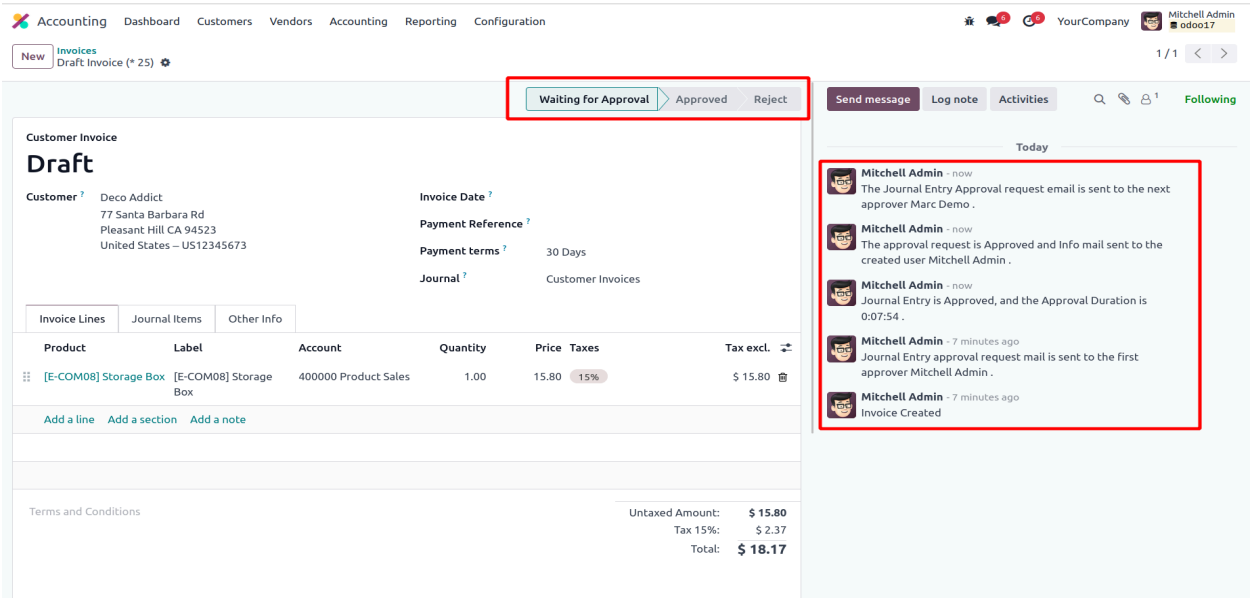

First Approver can see the buttons.

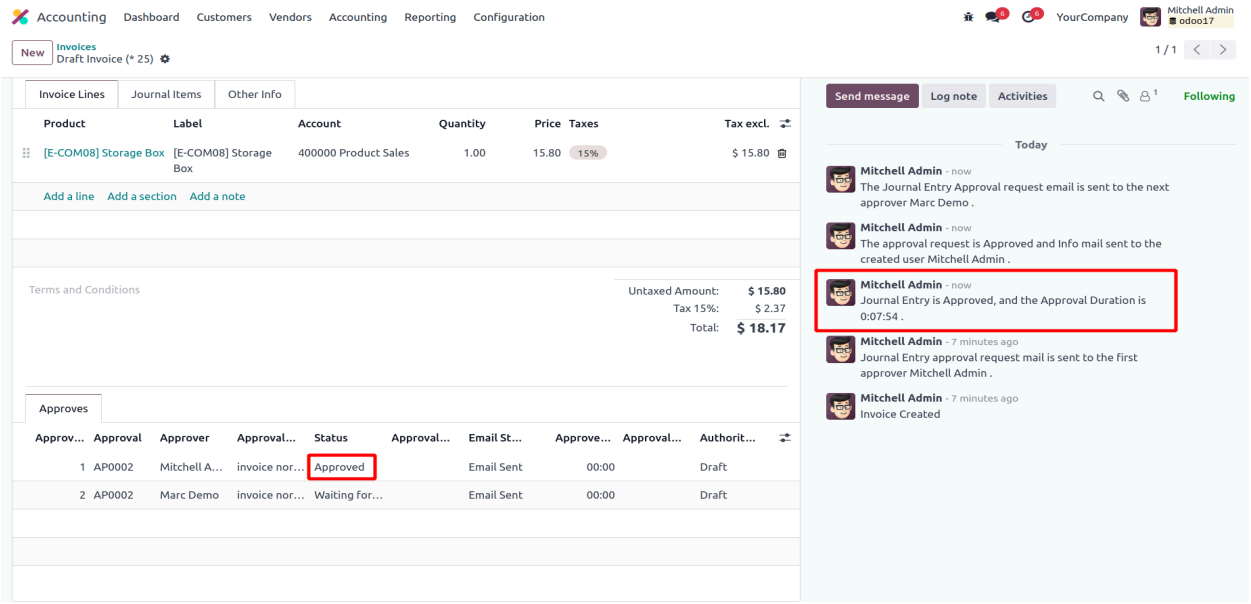

Other Approver only see it’s approval **tean**

Let’s check after the first approver approval.

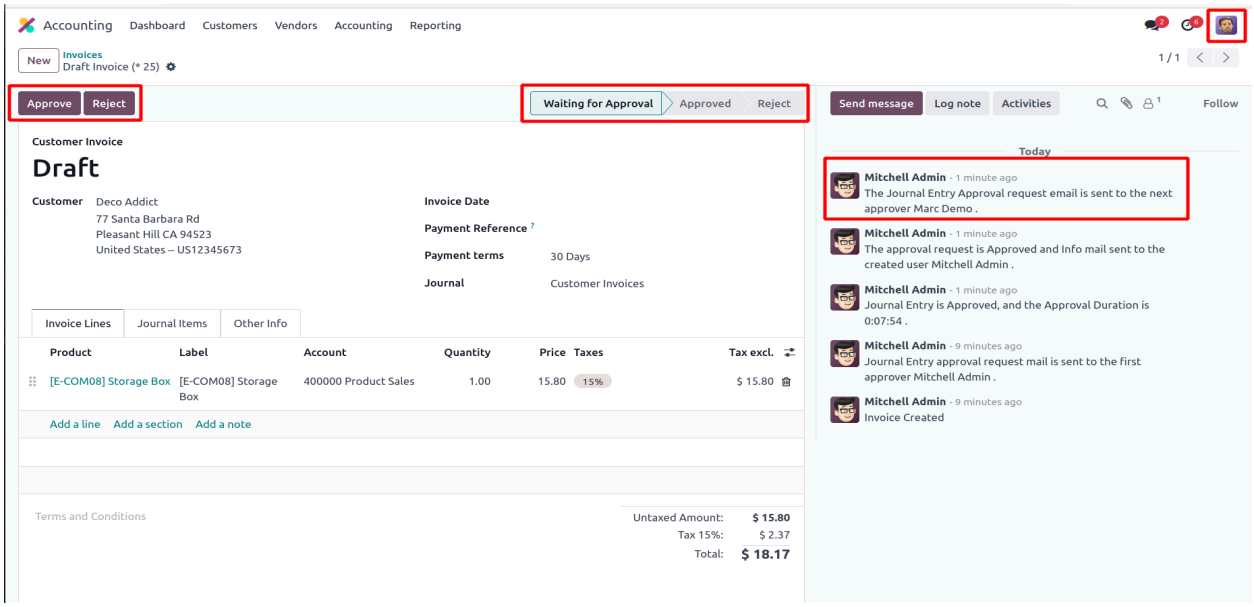

In the above screenshot, after the approval the buttons are invisible from the approver header,record the approval taken duration and update the approval status **waiting for Approval** to **Approved.**

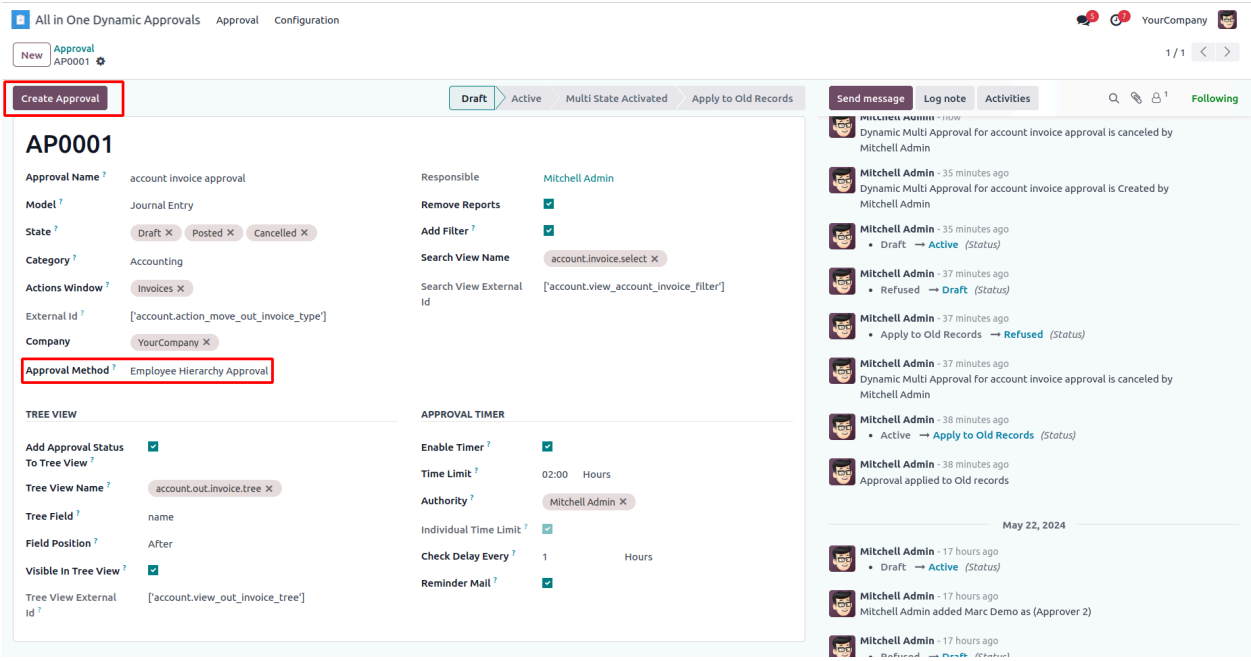

Then you can see the history in chatter. The chatter will keep the details. In case you will cancel the approval the approvers lister order line will remove but the history will keep in chatter.

Next we can check the second approval view, Now the approver can see the buttons.

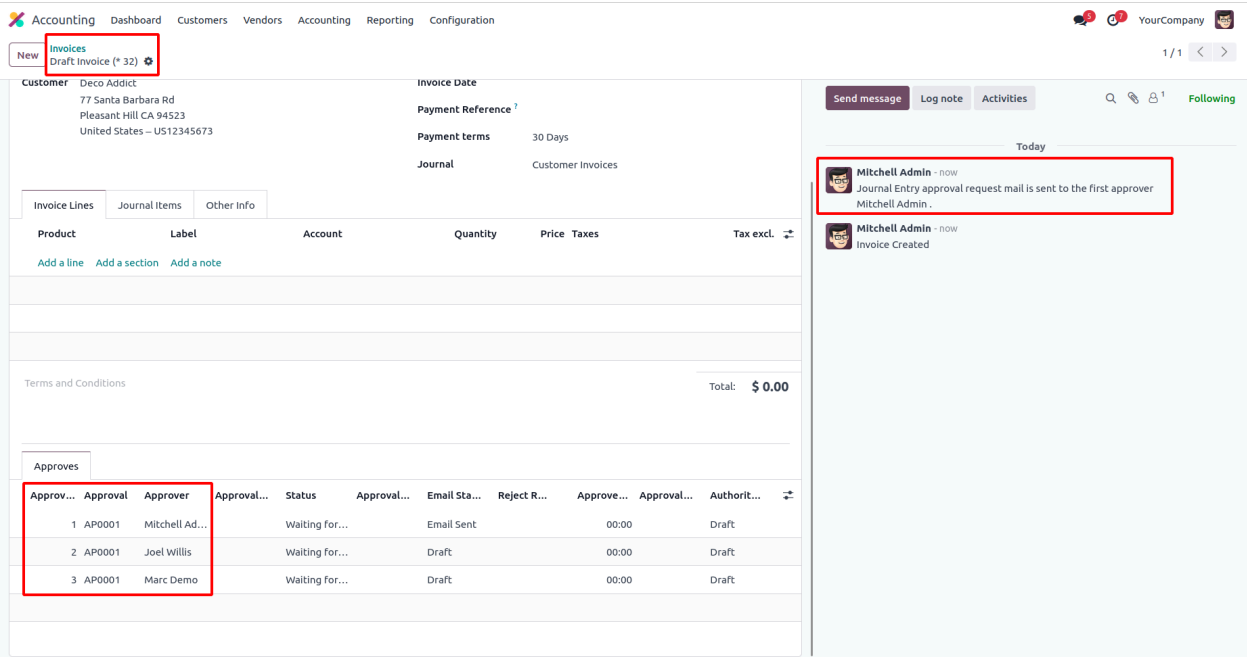

Other processes are the same in the parallel approval case. The Reject, Resend ...etc.

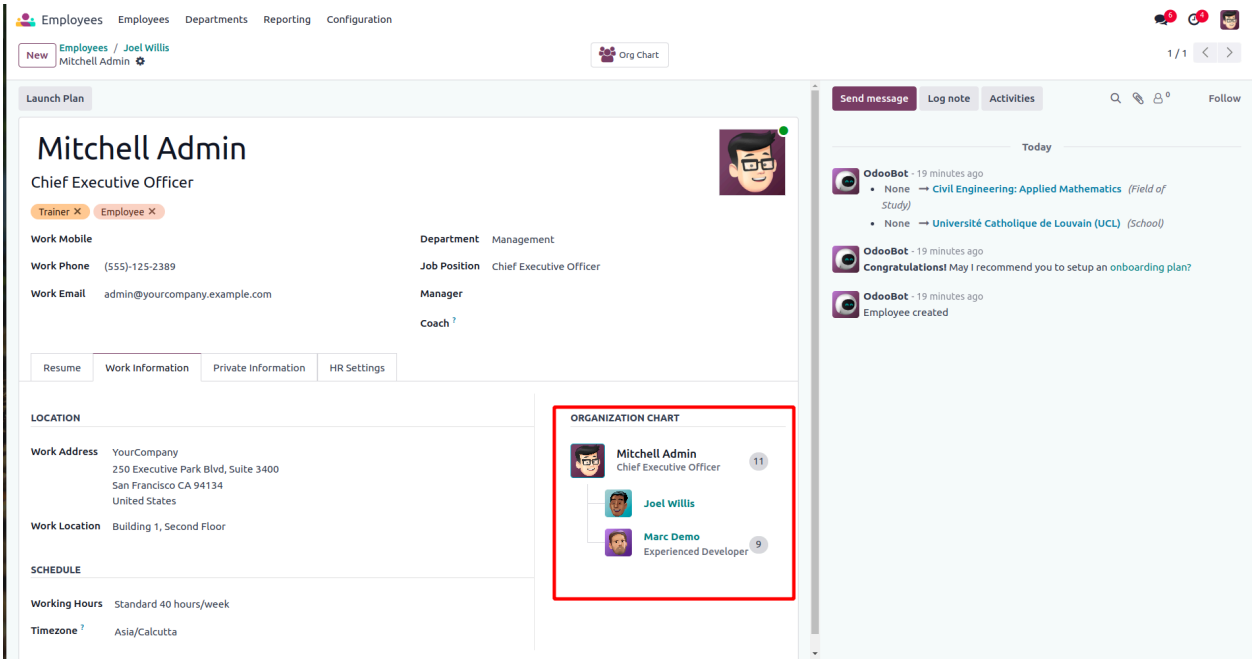

Next we can check the **Employee Hierarchy Approval,** For that first we need to create a Journal Entry's approval record in the approval model and have to check the organization Chart of the record creating user in the employee module. Let's see how it works.

First create a Journal entry with current user as Mitchell Admin.

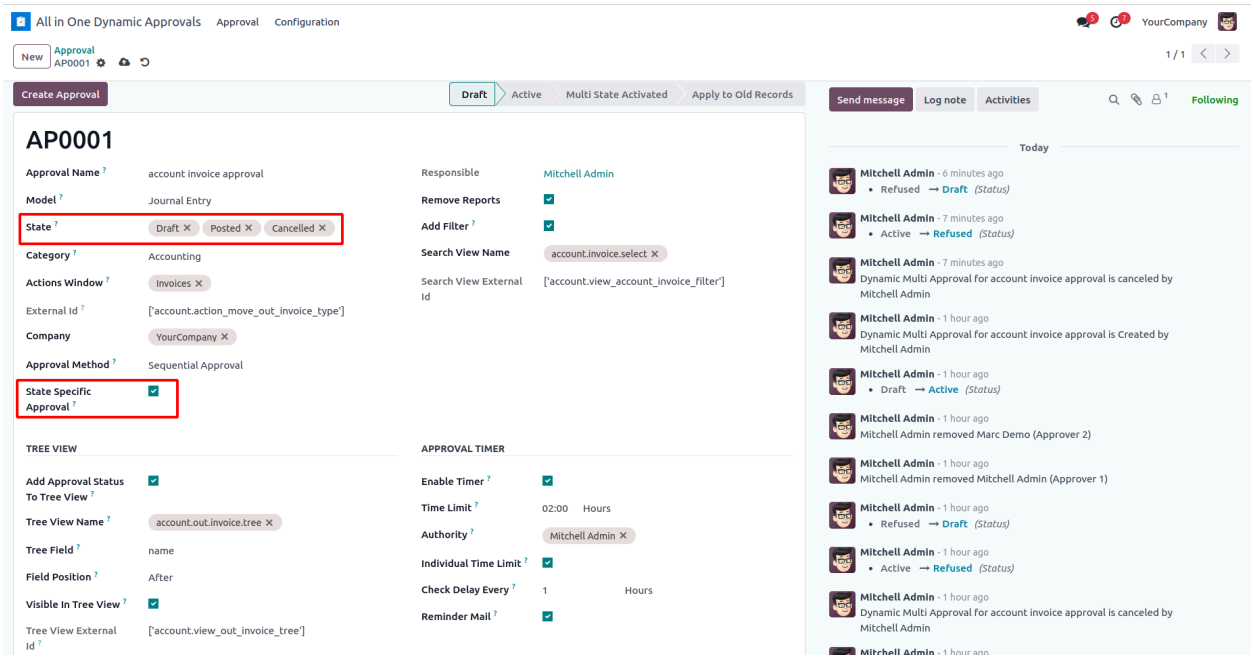

Here in the above image we can see multiple approver listed, Now let's have a look at the Organization Chart of the Mitchell Admin in the Employee module.

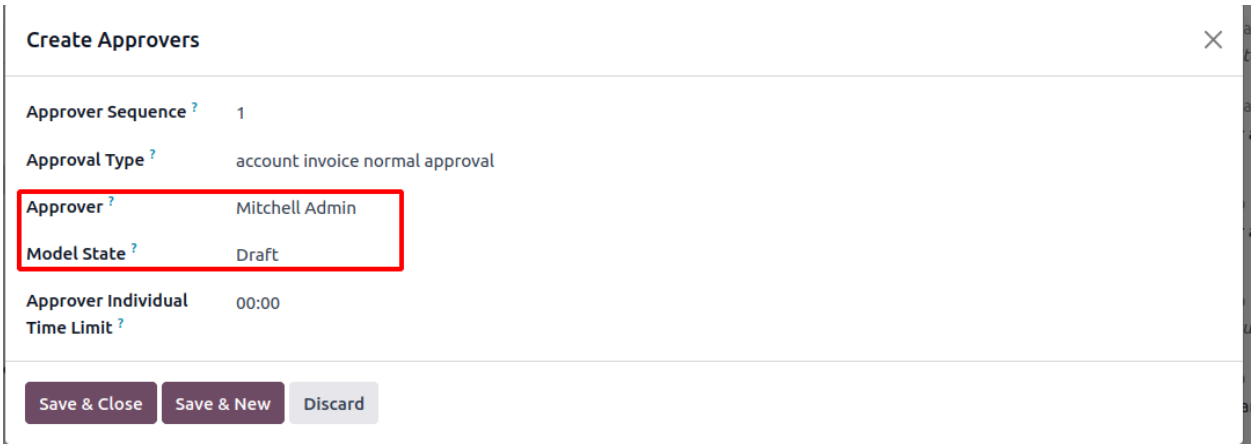

Here the above image we can see the organization chart of Mitchell Admin with the same people listed in the approval request of the sale order created by Mitchell Admin.

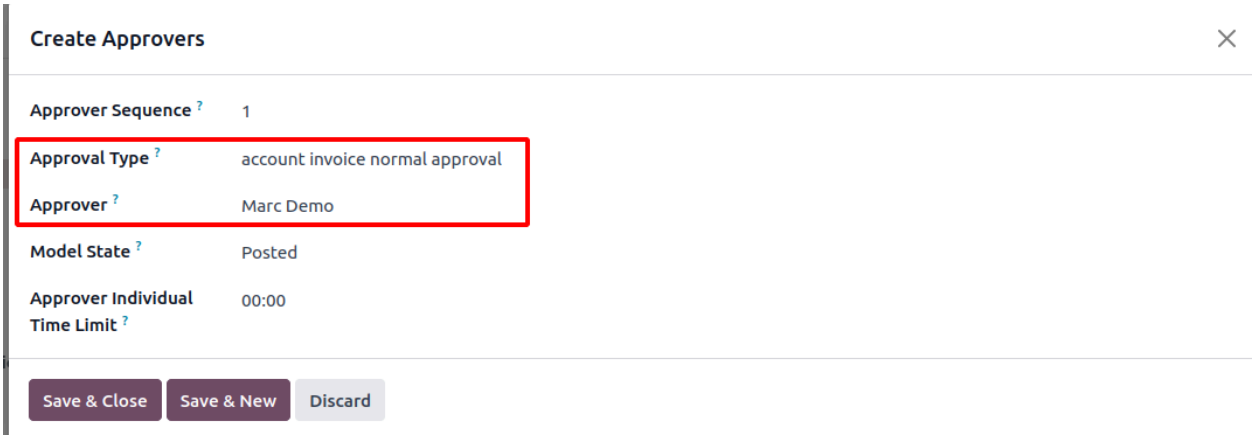

State Specific Approval

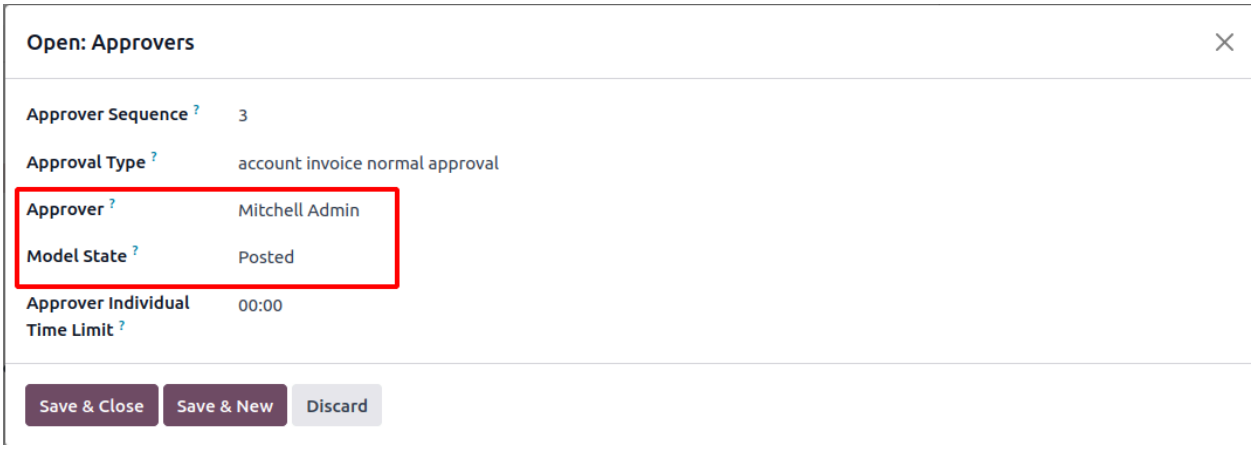

Now we can have a look on how state specific approval works, first make sure that this option is enabled while creating an approval to model and make sure approval method is not Heirarchy Approval.

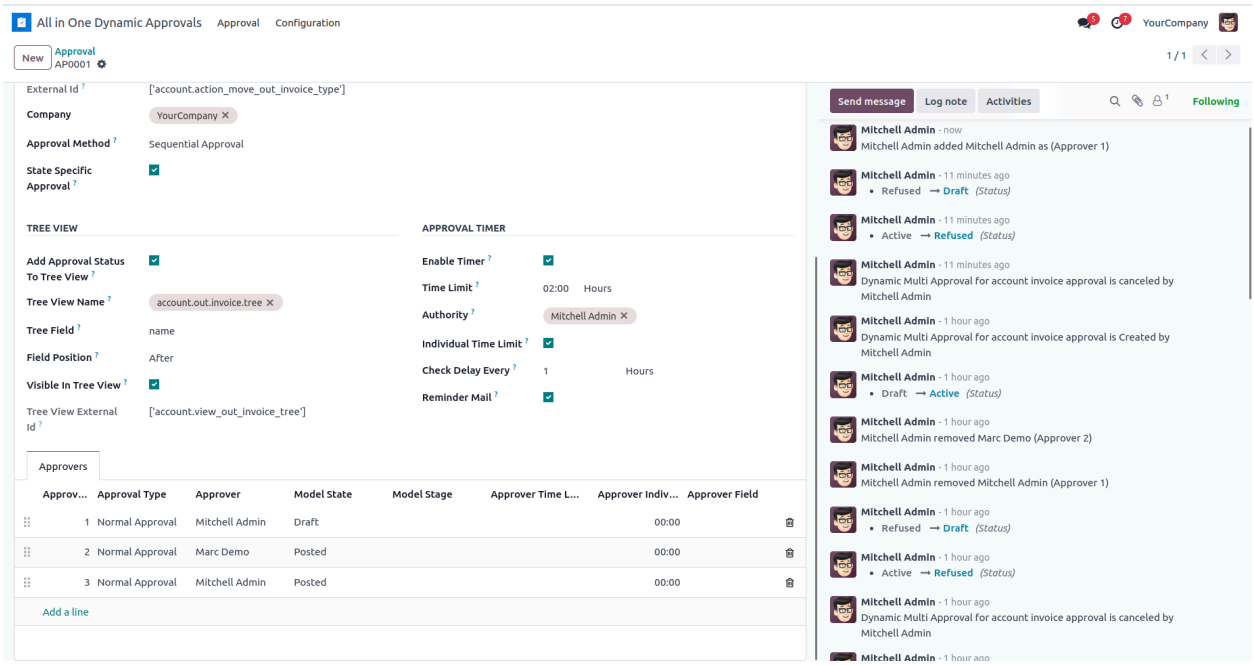

In state field we have to choose the state in which we need to set approvals and make sure state specific approval is enabled.

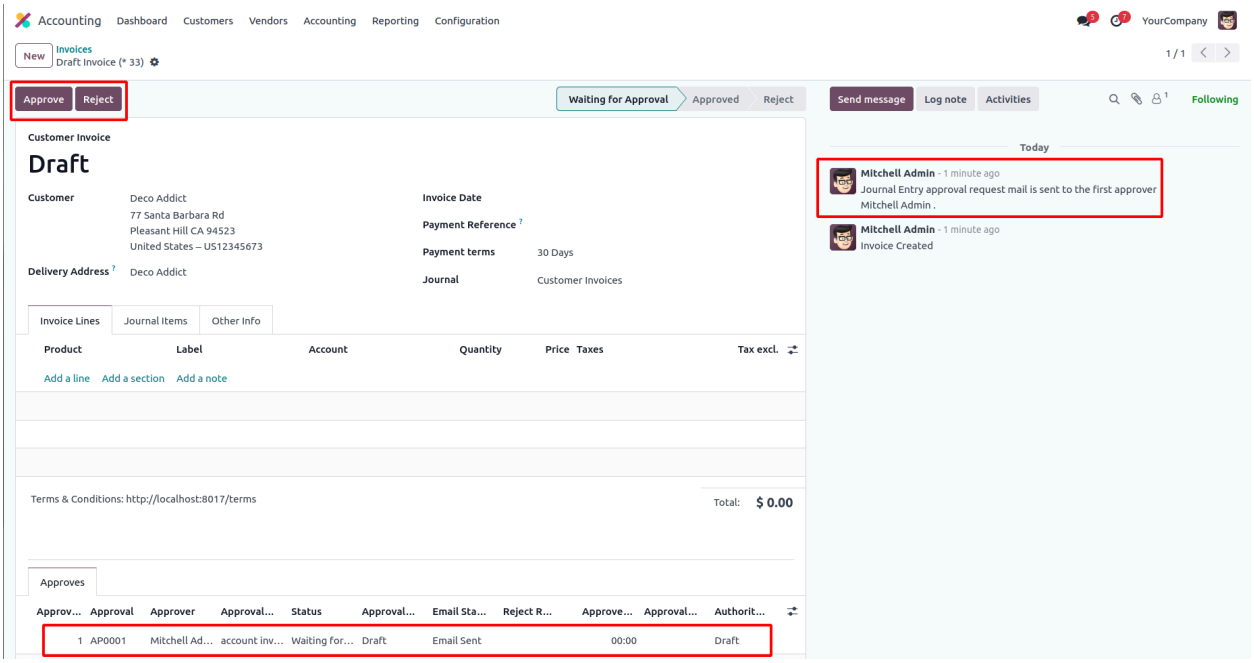

In the approver line we have to choose the model state and approver to approve the record, after choosing click on save like wise we can configure multiple approvers upon same state.

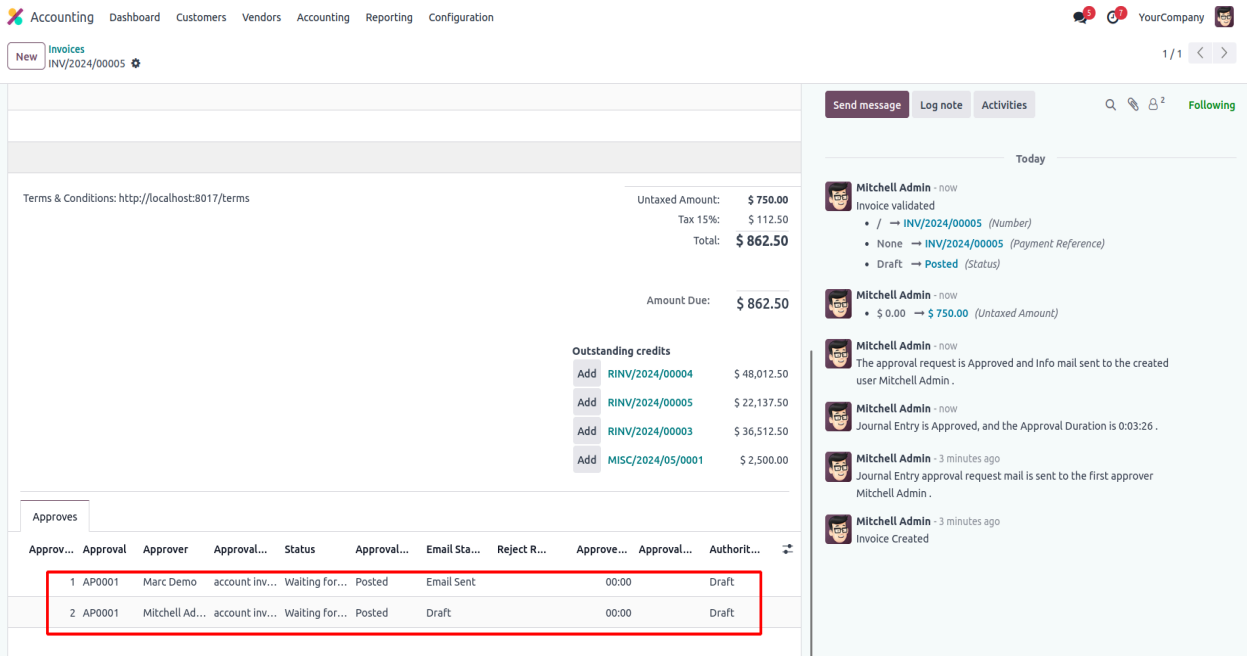

Here we can see that we have configured 2 approvals in state Posted Marc Demo as first approver then Mitchell Admin as second approver after in Draft state 1 approval that is Mitchell Admin. Now let’s see how this works.After clicking on create approval button let’s create a record in Journal Entry.

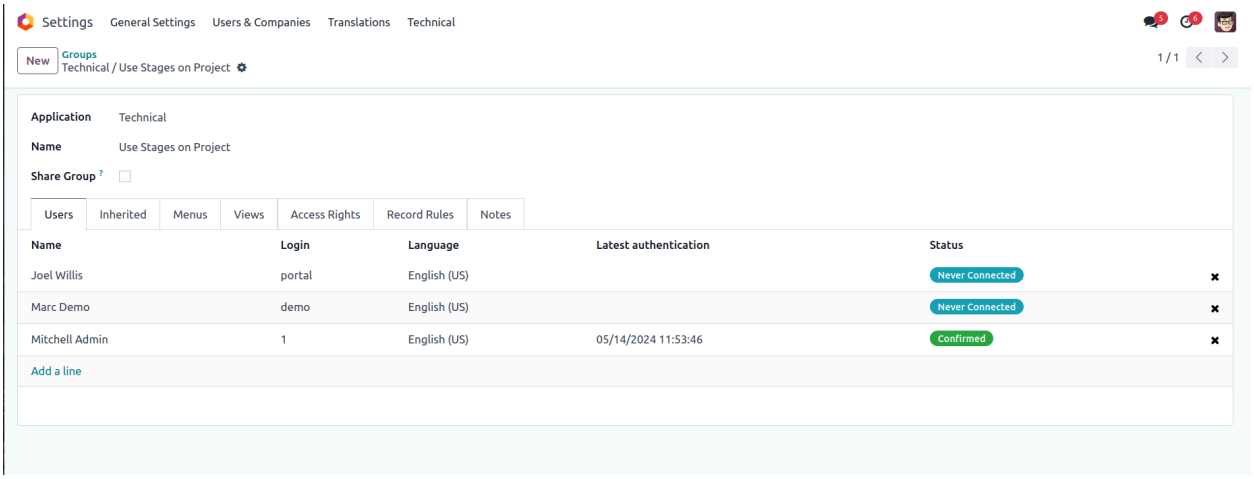

Here we can see in the Draft state approvers as configured as above after approved by approvers an state changed to state posted we can see a form as mentioned below

We can see that approval request is send to sale order approver Marc Demo and Mitchell Admin this is how state specific appproval ,

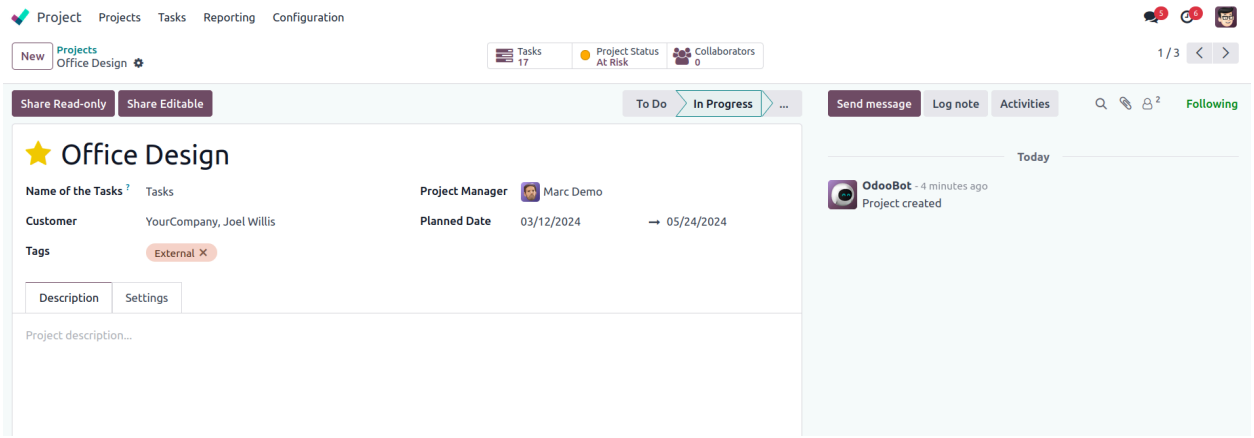

Now let’s see how we can set appproval to model Task and Project, in both case work flow is similar let’s have a look how we can set approval to task.

First of all we need to set users for groups “**Use Stages on Project**” for that go to settings ,Groups serach for it after that set users

and for prorper working of approval we need company_id field of the model in the case of project and task this field will only be visible in the form if there is more that 1 company is set.

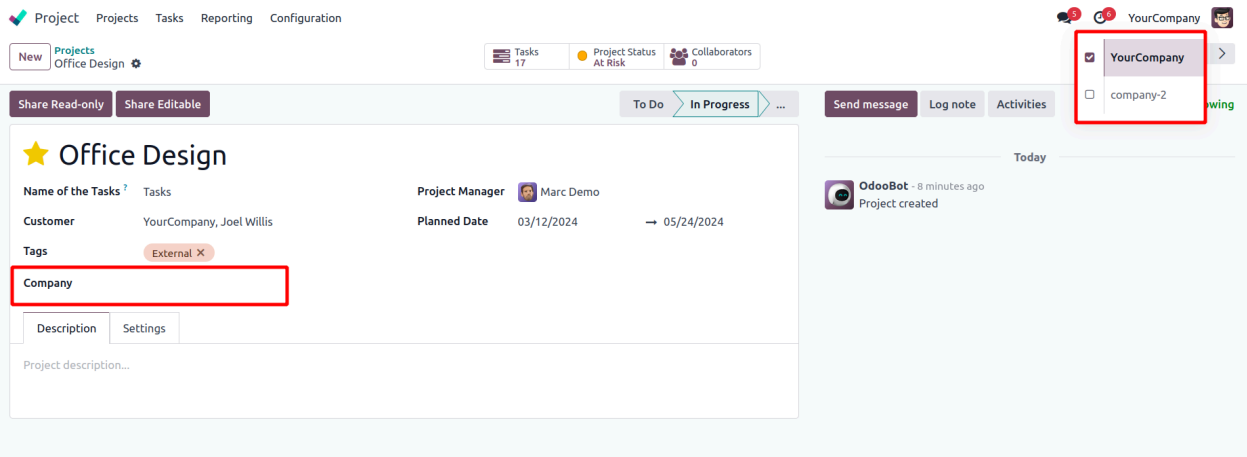

We know that tasks are majorly set under a project let’s see a project

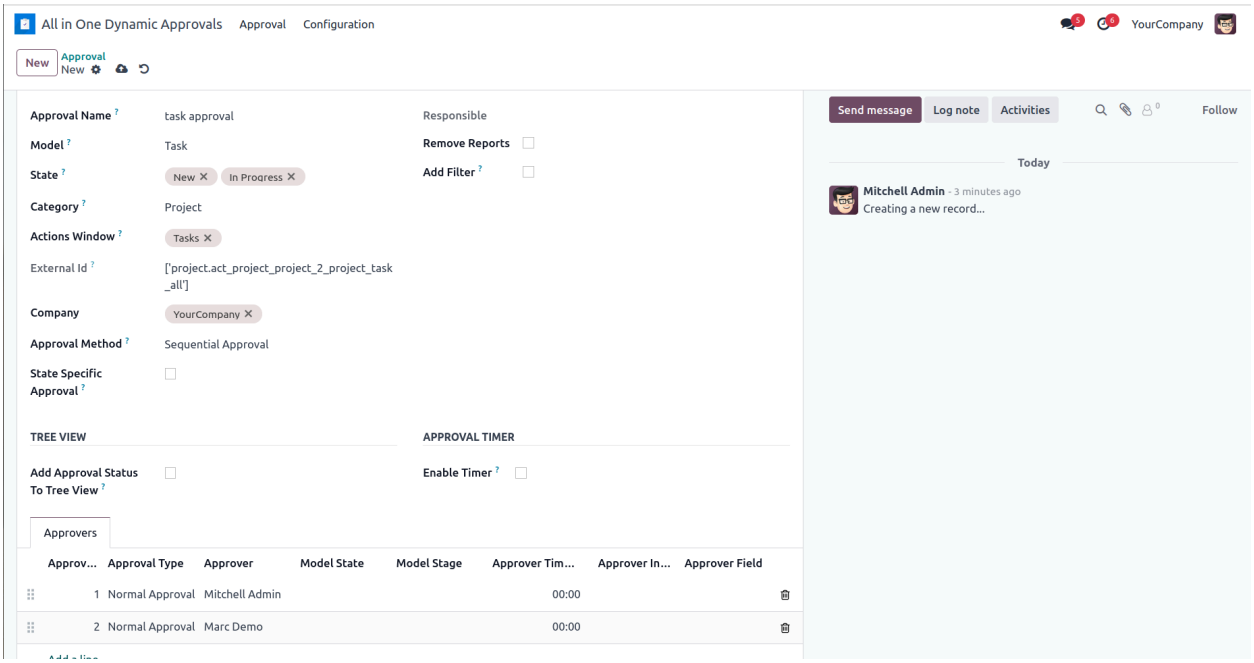

since only 1 company is set in systray we can see that there is no toggle company option and in the form we can see that there is comapany field

Now let’s create a company in the settings ,

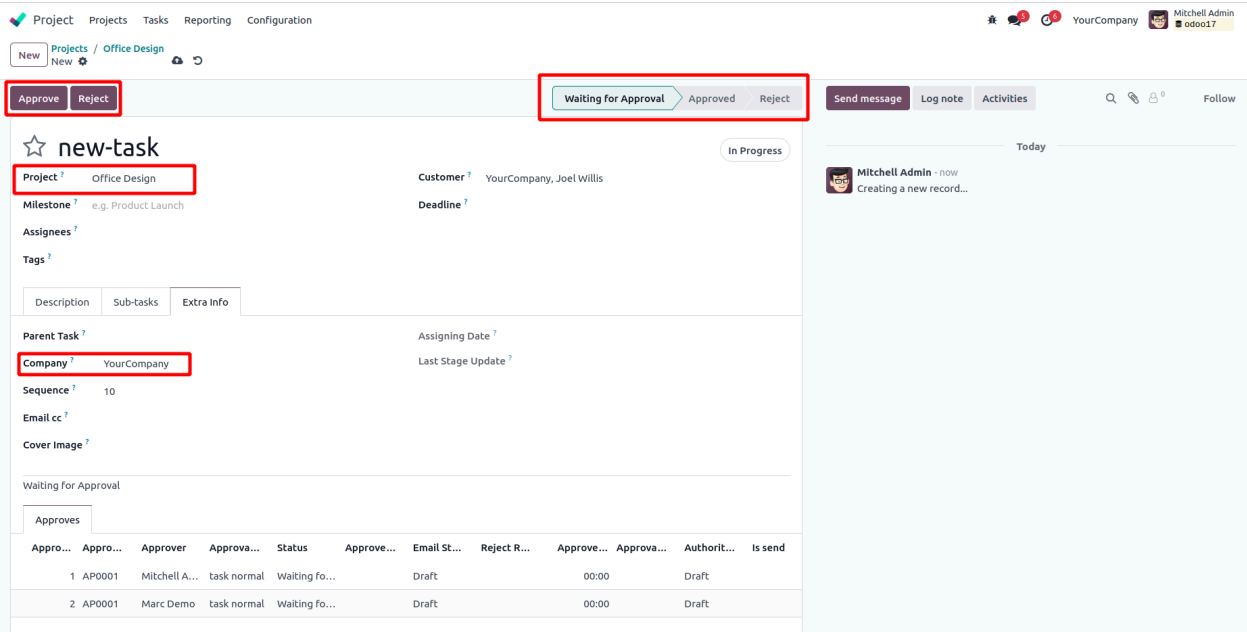

After creating the multiple company in the settings we can see that systray copany toggle is active and in the form company field is visible.

Choose a company in the company field and let’s create an approval for task model with choosed company.

Here i have created an approval record for model task, now let's create a task under any of the project let's say "**Office Design**".

Here we can see the approval is active for model task , same work flow is satisfied for the model project make sure to choose right action of the form while creating the approval record.
